

# Business Process Integration Using UML and BPEL4WS

---

**SI-SE 2004**  
University of Zurich  
March 18-19, 2004

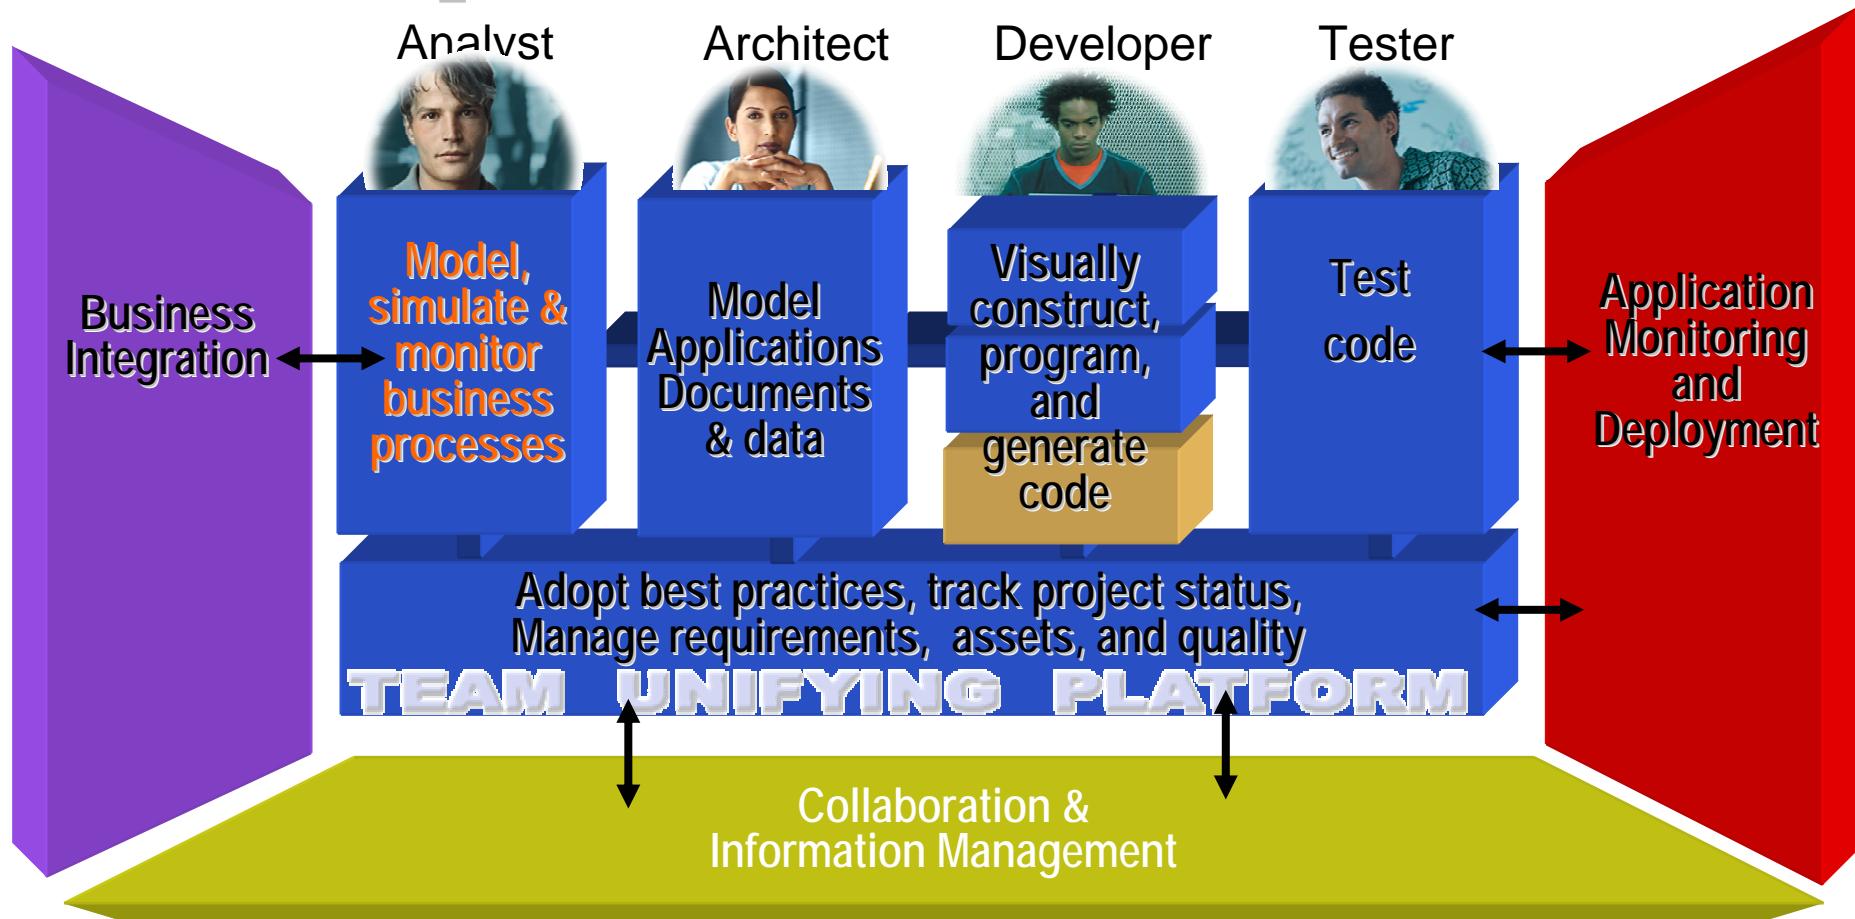

**Sridhar Iyengar**  
Distinguished Engineer, IBM Rational Software  
*siyengar@us.ibm.com*

# *Software Development & Integration*

## *A ‘team sport’ that IBM Rational enables*

# ***“Components – The Future of...”***

- ‘Components’ – Too many definitions , therefore different types of components
  - Java Beans, EJBs, Eclipse plug-ins, CORBA components, Web Services (W3C, OSGi...), Classes (C++, Eiffel, Java, UML1, UML2), Structured Classes (UML2), Component (UML2)
- Important to discuss the Architectural framework (J2EE, .Net, Web Services AF, MDA) in which the ‘components’ are defined, deployed, used
  - Can’t wire a EJB component and a COM component WITHOUT defining the interoperability protocol (hopefully via Web Services)
- Component Assembly (intentional wiring of components to compose coarser grained components) and composition is essential

**Industry needs consistent definitions and implementations  
if the dream of reuse thru component assembly is realized**

**Work In Progress (Eclipse, J2EE, Web Services, .Net, MDA components)**

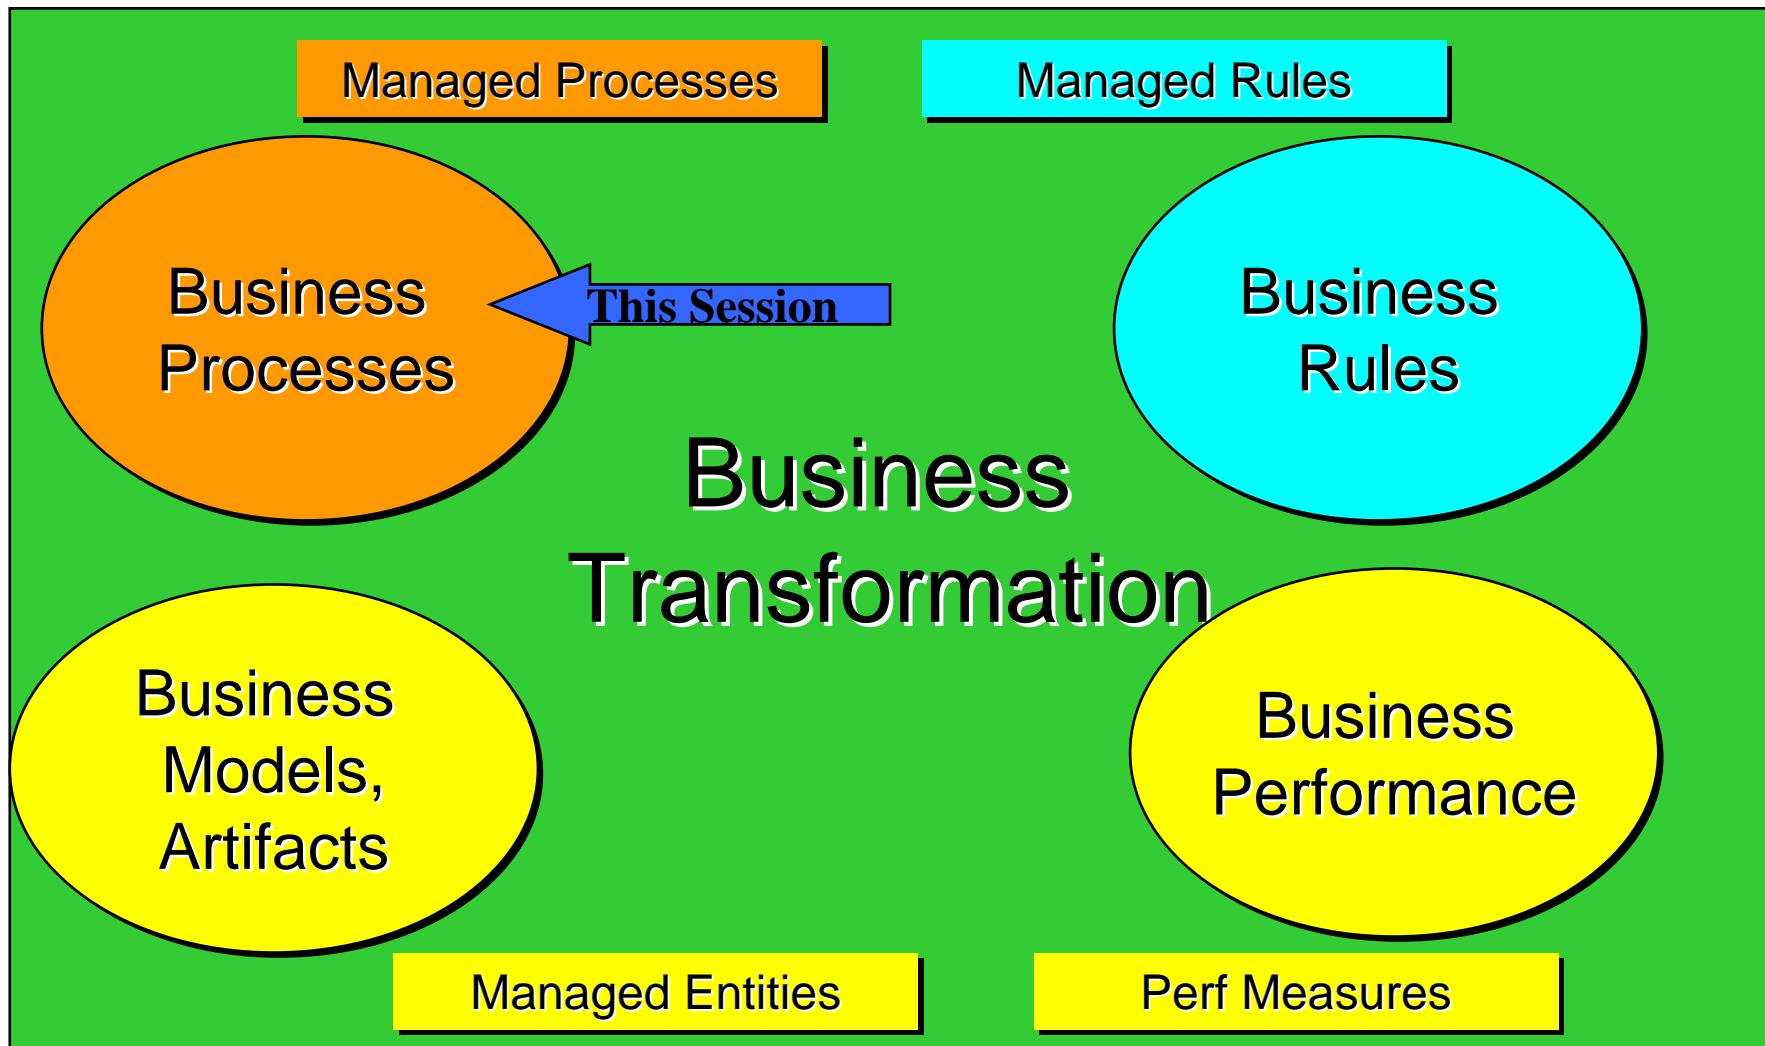

# *What this session is & isn't about*

- We will cover
  - Motivation for the UML2BPEL work (i.e why this is important)
  - An overview of recent work on ‘bridging’ the OMG MDA (Model Driven Architecture) work to the SOA and Web Services work at W3C and OASIS
  - Relationship between Components and Web Services
  - Some UML patterns for modeling Web Services & Services Oriented Architecture
  - Progress in OMG on mapping UML 2.0 to BPEL4WS & BPMN
  - The profile is based on BPEL4WS 1.0 (this is being updated to 1.1)
- We will NOT cover
  - Details of UML or UML metamodel (we will show by example)
  - Details of MDA
  - Details of BPEL4WS and rest of the Web Services Stack
  - Or propose YACM (Yet Another Component Model)
- Please hold questions to the end – we have quite a bit to cover!

# *Business Models, Processes and Rules*

## *Context for ‘Business Process Integration’*

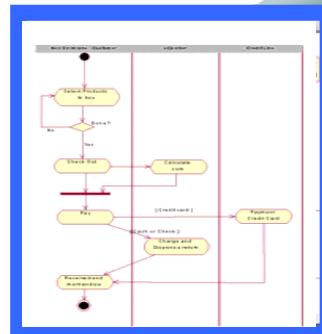

# *Solving the Integration Problem*

## *What is needed?*

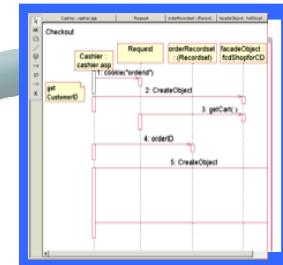

- Short Answer ‘was’ XML and HTTP ala SOAP!
- Slightly longer answer is SOAP, WSDL, UDDI
- Even longer answer is SOAP, WSDL, UDDI, BPEL4WS, XQuery, WS\* standards... with J2EE, .Net etc.
- The real answer is : many of the buzzwords above are fine, but
  - We need to think and build software & standards like engineers
  - Where is the process, methodology and architecture, discussion of the full application lifecycle? – A focus for OMG MDA and how it bridges modeling, methods, tools and middleware technologies
  - Somehow we need to simplify this complex mess!
- The OMG Architecture Board, W3C Web Services Architecture WG, OASIS TCs have started to look at this issue from different but complementary perspectives
- Need to form ‘bridges’ between the architectural communities & standards groups that are addressing piece parts of solution

# *Focus on Architecture is Essential*

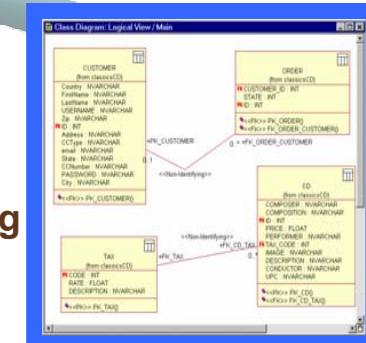

- Use component-oriented and service-oriented architectures
- Model visually

Business Modeling

Application Modeling

Data Modeling

**Business applications**

Adapt *quickly* to changing business needs

Create strategic advantage

Are reliable, scalable and manageable

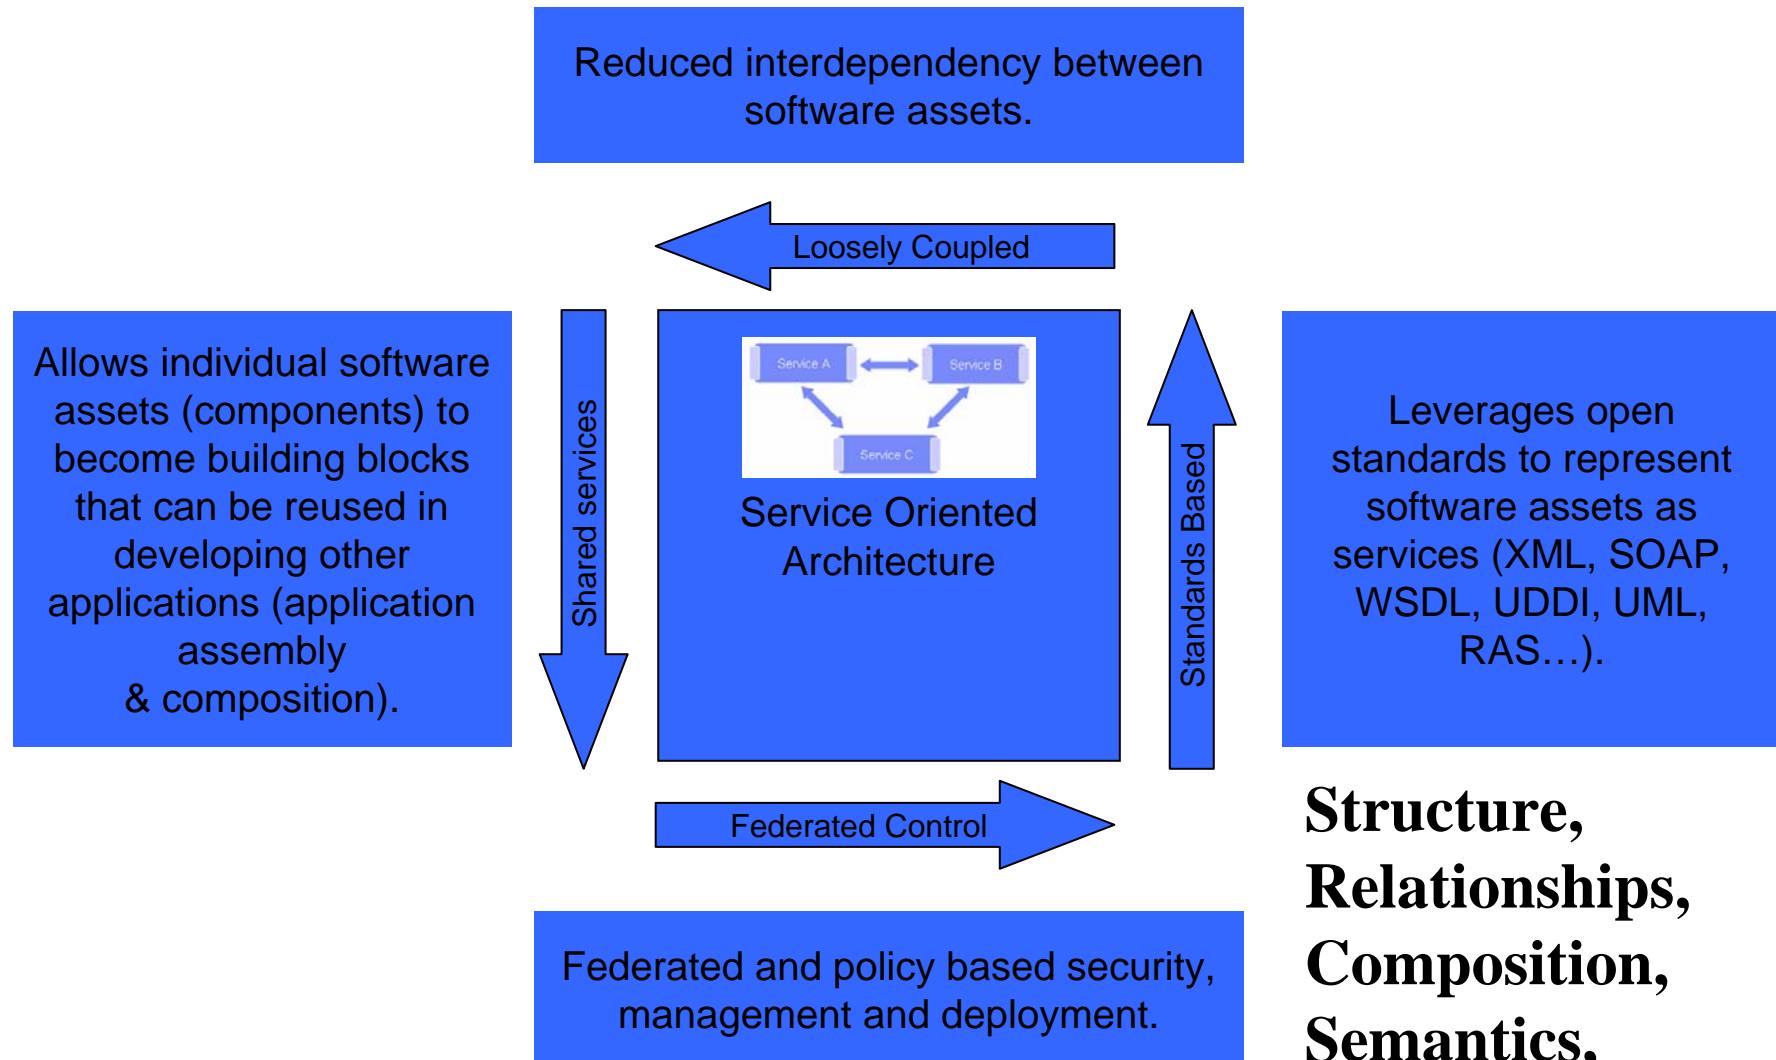

Focus on architecture to...

Design for change

Reduce complexity; work at the right level of abstraction

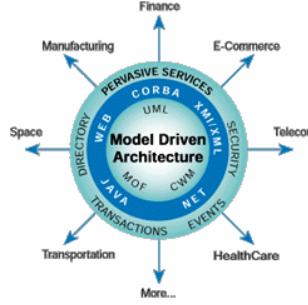

Ensure architectural integrity and ultimate quality

# *Characteristics of Service Oriented Architecture*

# *Service Oriented Architecture & Component Based Development*

- Secure, Reliable, Transacted Web Services
  - <http://www-106.ibm.com/developerworks/webservices/library/ws-securtrans/>
- Using Service Oriented Architecture & Component Based Development to build Web Services Applications
  - <http://www-106.ibm.com/developerworks/rational/library/510.html>
- Modeling XML Applications with UML
  - <http://www.xmlmodeling.com/DesktopDefault.aspx>
- From UML to BPEL
  - <http://www-106.ibm.com/developerworks/library/ws-uml2bpel/?ca=dnt-436>
- OMG Business Process Definition Metamodel RFP
  - [http://www.omg.org/techprocess/meetings/schedule/Business\\_Proc\\_Def\\_Metamod\\_RFP.html](http://www.omg.org/techprocess/meetings/schedule/Business_Proc_Def_Metamod_RFP.html)
- Web Services best practices
  - <http://www-106.ibm.com/developerworks/edu/ws-dw-wsbestprofil-i.html>

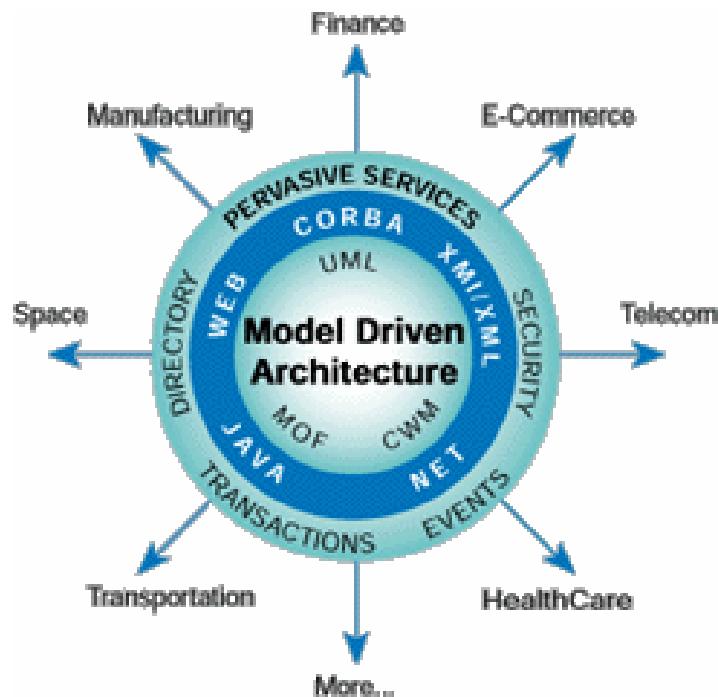

# *An Overview of OMG Model Driven Architecture*

An Architectural Style & a set of standards that enables the use Industry Standard Models, Metadata, Mappings (Patterns & Transformations) for building & integrating software.

MDA allows architects & developers to productively *design, build, integrate and manage applications throughout the application lifecycle* .

# *MDA: Model Driven Architecture*

[www.omg.org/mda](http://www.omg.org/mda)

**Key Concept:**  
Models & Model Transformations  
Based on standard Metadata Models

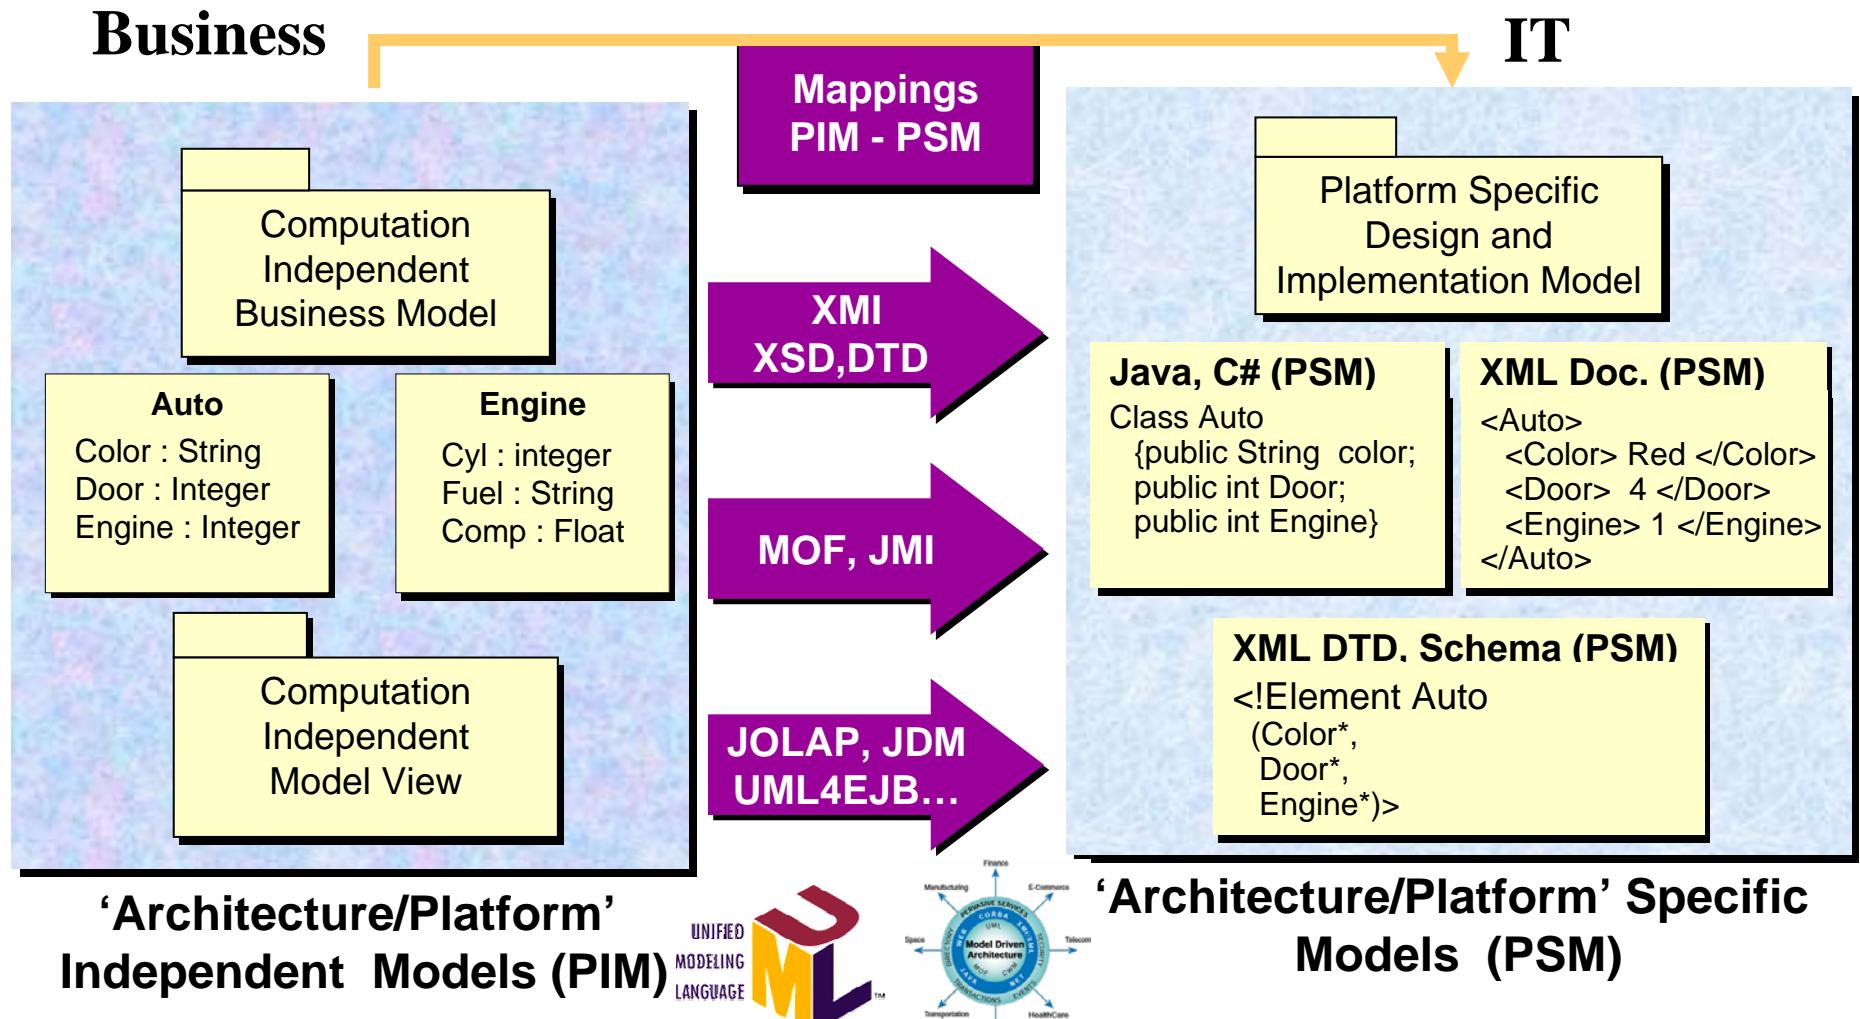

- An integration of best practices in Modeling , Middleware, Metadata and Software Architecture
- Model Driven (UML, MOF, CWM...)
  - Platform Independent Business Models (PIM)
  - Platform Specific Models (PSM)
  - Mappings : PIM <==> PSM, PSM<==> PSM (Relative term!)
- Metadata Driven (MOF, XSD, XMI)
- Key Benefits
  - Improved Productivity for Architects, Designers, Developers and Administrators
  - Lower cost of Application Development and Management
  - Enhanced Portability and Interoperability
  - Business Models and Technologies evolve at own pace on platform(s) of choice

# *MDA as an ‘Architectural Style’ for Model Driven Integration*

- Understand the problem domain (technology or business)
- Model the problem domain
  - Use UML for the visual modeling, analysis & design of meta model
  - Use a UML compliant tool/repository that supports XMI import/export
  - Define Domain Specific Modeling Languages (aka MetaModels) as needed
  - **‘In Progress’ : Make UML & MDA more data/information/web services modeler friendly, provide Business/IT visualization – not just ‘OO/CBD’**
- Formally represent the metamodel semantics using MOF
  - Simple class modeling is all you need to know
  - OCL (Object Constraint Language) can capture additional semantics
  - Reverse engineer existing DTD, XSD, XMI, Java to MOF (jump start)
- Use Standard transformation (**mappings**) patterns for
  - Metadata Interchange (XMI – MOF to XML, DTD, XSD)
  - Metadata Interfaces (JMI – MOF to Java, MOF to WSDL\*, MOF to IDL etc.)
- Use open source meta modeling frameworks for metadata **management**
  - Eclipse EMF : [www.eclipse.org/emf](http://www.eclipse.org/emf)
  - Netbeans MDR : [www.netbeans.org](http://www.netbeans.org)
- Summary : **Understand, Model, Map and Manage** metadata to integrate

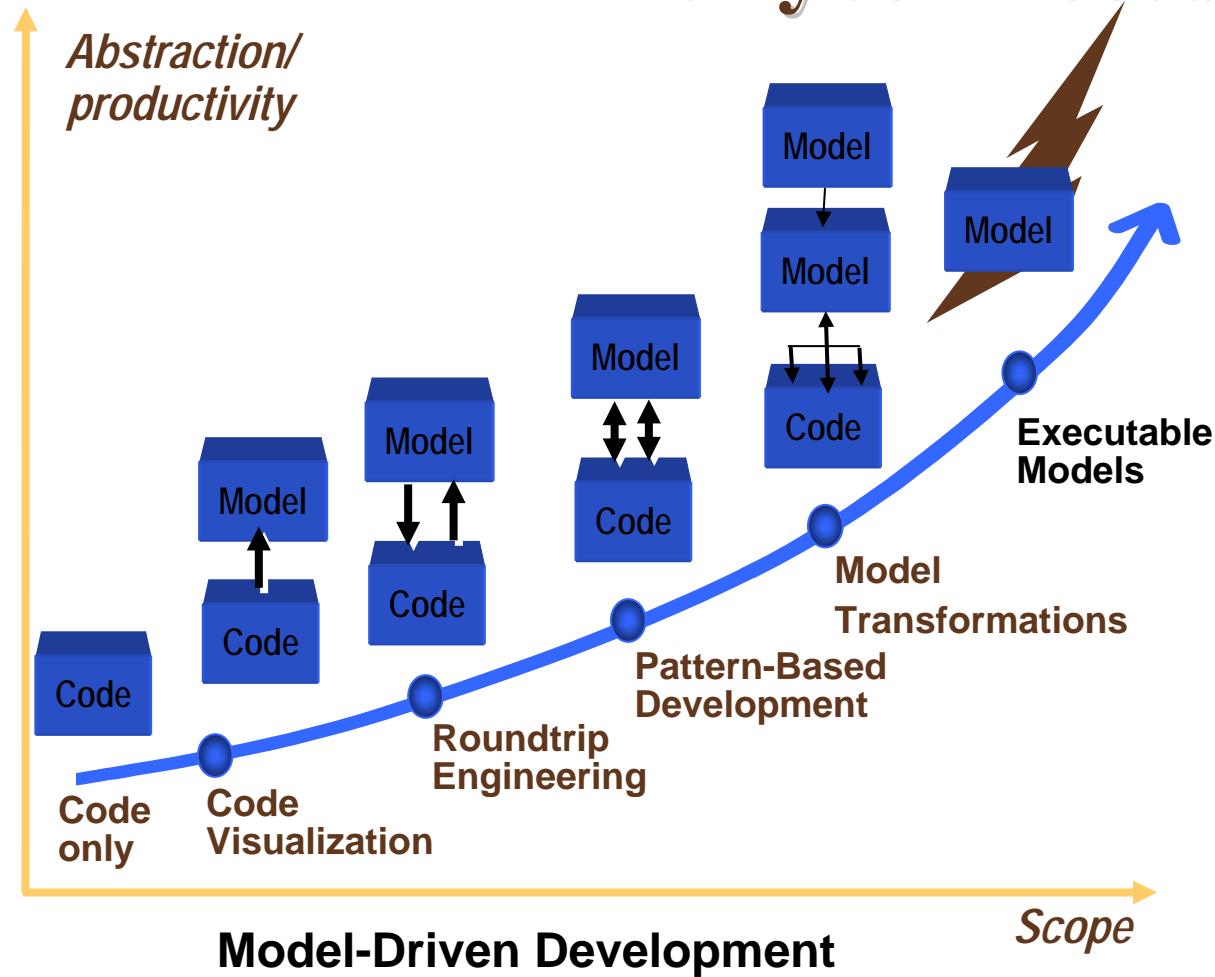

# *Model Transformations using OMG Model Driven Architecture (MDA)*

# *Choice of Modeling Paradigms*

## Adopt the right modeling paradigm for your needs

### UML & MDA Standards

*Supports multiple:*

- ▶ Development languages
- ▶ Operating environments
- ▶ Skill levels
- ▶ Modeling paradigms

### Key MDA Standards

**UML**

**XMI**

**MOF**

[www.omg.org](http://www.omg.org)

[www.eclipse.org/emf](http://www.eclipse.org/emf)

[www.eclipse.org/uml2](http://www.eclipse.org/uml2)

[www.eclipse.org/xsd](http://www.eclipse.org/xsd)

# *Web Services Overview*

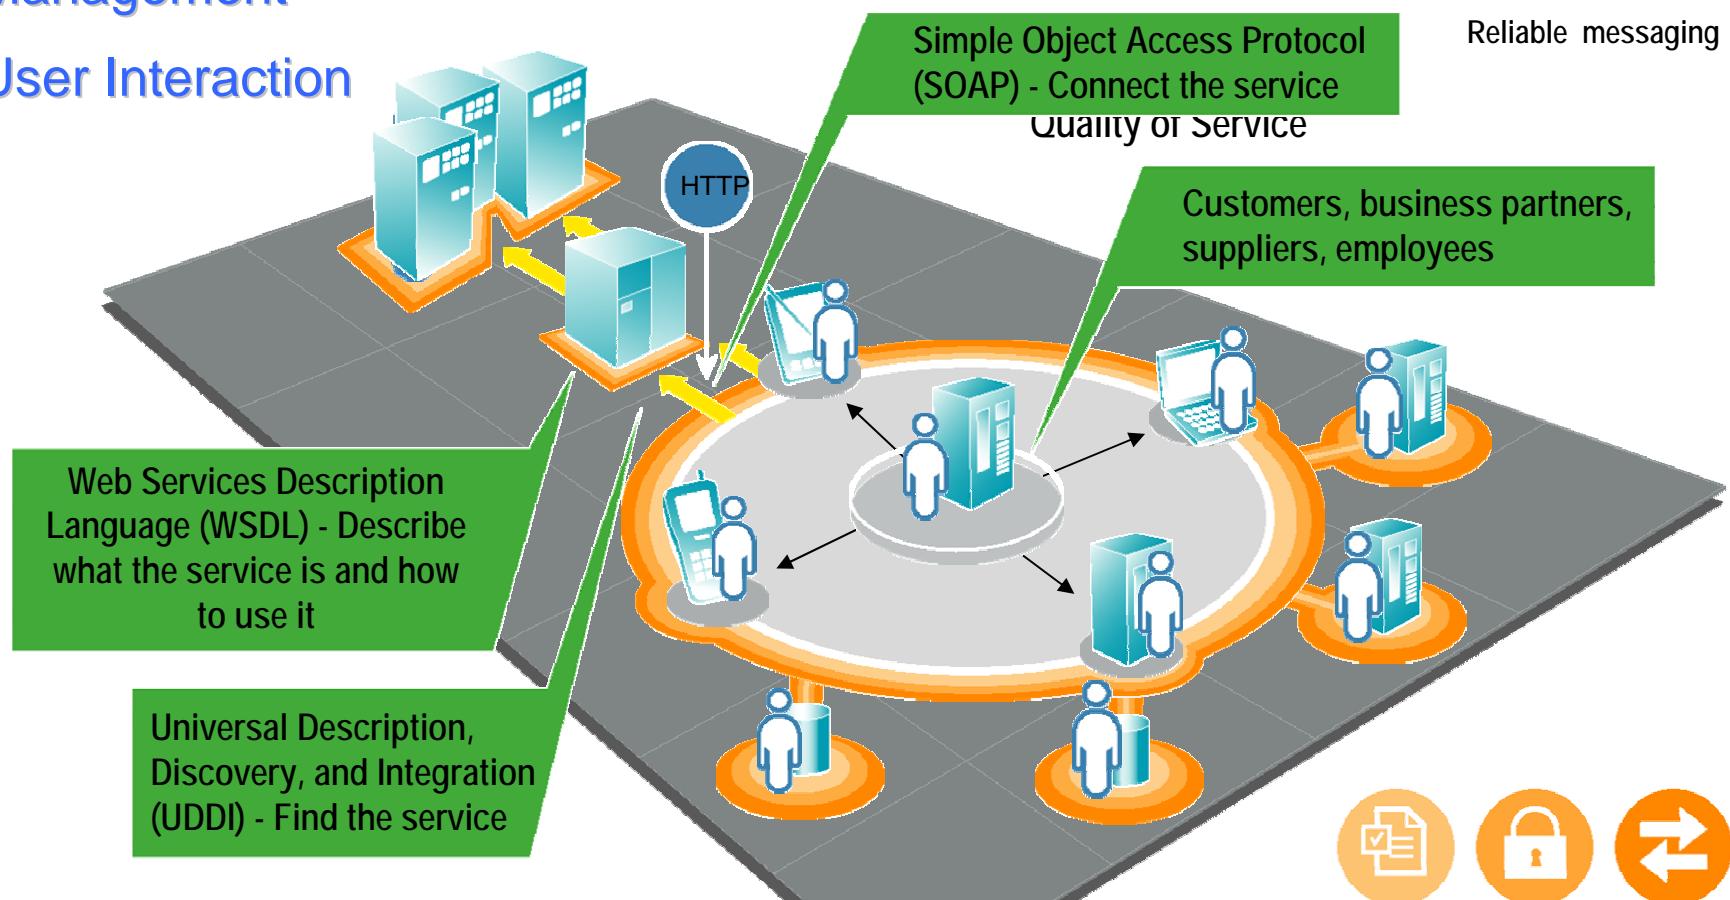

Web services enables application/business process/people interaction

Business Process

Management

User Interaction

*Web services enables application/business process/people interaction*

# *What are the hot standardization areas today in web services?*

- Security

**Program well underway in OASIS, uncontroversial. WS-Federation is well received.**

- Reliability

**Two new specifications and a Reliability Roadmap paper published March, 2003.**

- Business Process Choreography and Transactions

**Specs published August, 2002, convergence of work from IBM and Microsoft, now in OASIS.**

- Management

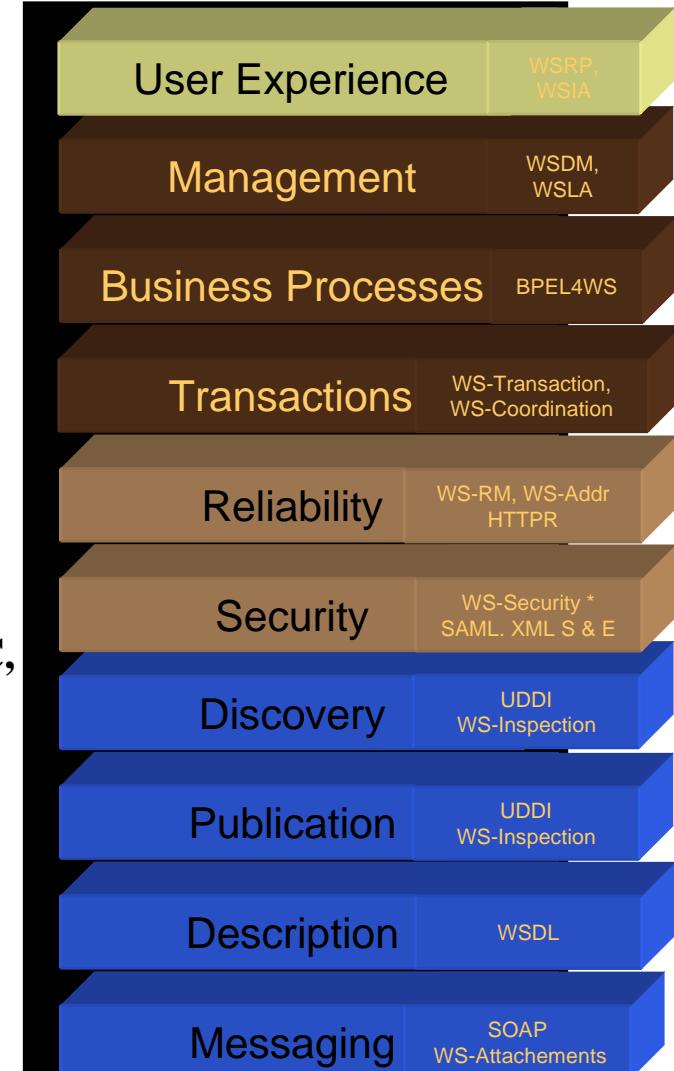

**Work is early stage, but good coordination among OASIS, W3C, GGF, and DMTF.**

- Interoperability

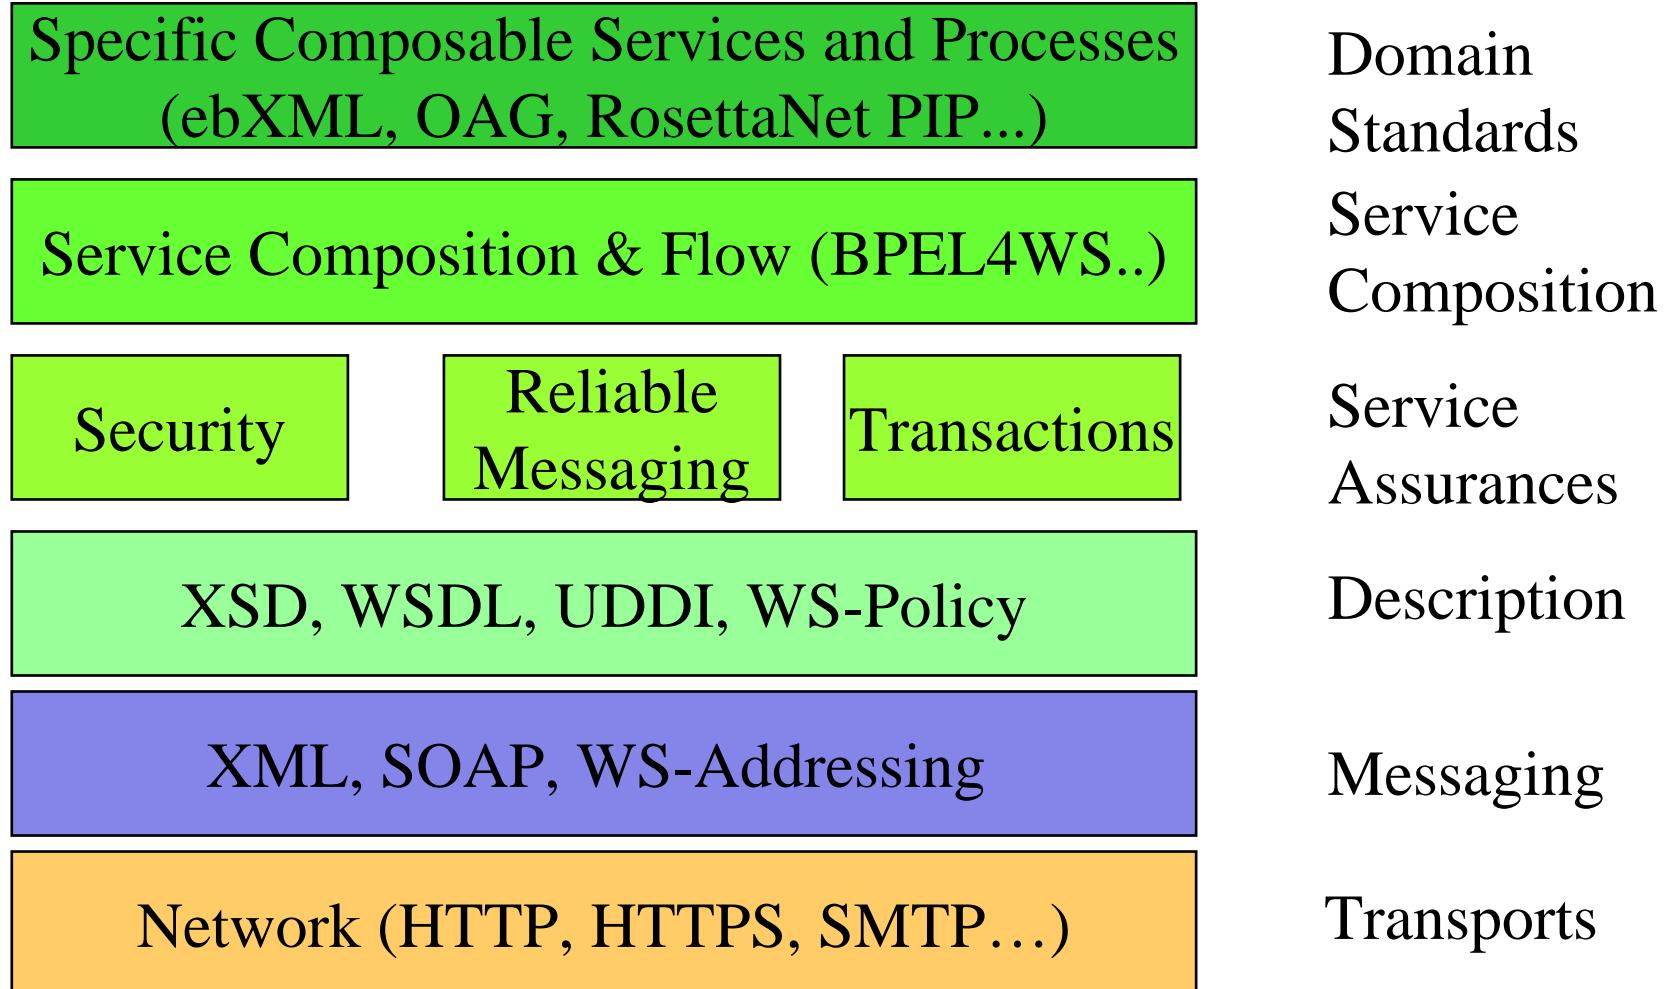

**WS-I.org is the place to be and the work to watch.**

- User Experience

**WSRP is an OASIS TC specification with many vendors announcing product.**

# *Web Services : The ‘Standards Stack’ Evolves in W3C, OASIS and WS-I*

Not intended to be viewed as a ‘software stack’

# *Modeling & Design for Web Services*

- UML can be used to model Web Services
  - Web Service Operations (WSDL Operations) as UML Operations
  - Groups of Web Service structures Requests (WSDL PortTypes) as UML Interfaces or Classes
  - XML Schemas using UML Class Diagrams
  - Web Services data structures using UML Class Diagrams
  - Web Services flow (E.g.:BPEL4WS) using UML Activity Diagrams
  - UML2 Structured Classes & Components add additional support for Architectural Modeling
- MOF and XMI can be used to define standard transformations from models to XML schemas, DTDs, Documents
  - [www.eclipse.org/emf](http://www.eclipse.org/emf), xsd, uml
- But standard metamodels, transformations, UML profiles etc, would be useful
  - <http://www.omg.org> (MOF, XMI, UML and CWM specs)
  - XMI - Mappings from MOF/UML to XML DTD, XML Schema
- Using Service Oriented Architecture & Component Based Development to build Web Services Applications
  - <http://www-106.ibm.com/developerworks/rational/library/510.html>
  - Modeling XML applications with UML by David Carlson
    - <http://www.xmlmodeling.com>
- UML to BPEL4WS mappings
- From UML to BPEL
  - <http://www-106.ibm.com/developerworks/library/ws-uml2bpel/?ca=dnt-436>

# *A peek at integrating Business Processes using UML and BPEL4WS*

See the BPEL4WS spec for the examples, BPEL4WS syntax

    See OMG UML spec for details on UML

    Read many popular books , use tools

Possible standard UML profile for BPEL

BPEL4WS tools still emerging

Update : BPD Profile submitted to OMG  
Mapping to BPEL4WS 1.1 in progress

# *Business Process Execution Language for Web Services (BPEL4WS)*

- The Business Process Execution Language for Web Services (BPEL4WS) provides an XML notation and semantics for specifying business process behavior based on Web Services.
- A BPEL4WS process is defined in terms of its interactions with partners. A partner may provide services to the process, require services from the process, or participate in a two-way interaction with the process.
- A short summary of research underway at IBM is described to illustrate how MDA and models can be used for business process integration
- BPEL4WS products are beginning to show up in the market – more in 2004 (tools and engines)

**Submitted to OASIS by IBM, Microsoft, BEA, SAP & Siebel**

# *Web Services, Components & Services Orchestration*

- Components are implemented using J2EE, .Net, CICS transactions...
- Components support defined extension points (think Eclipse Plug-ins, UML2 Components and Ports)
  - Provided Interfaces (Services offered to other components)
  - Required Interfaces (Services required by this component)
- Components can be ‘wired’ together explicitly to assemble ‘coarser grained’ components
  - ‘Connectors’ in UML2 (influenced by ACME, UML4RT...)
  - ‘Service references’ in BPEL that allows Integration partners to refer to each other (‘soft references’)
- Components can be orchestrated at runtime (role of BPEL)

# ***Unified Modeling Language (UML)***

- Visual Modeling Language for analysis, design and construction of software
  - Widely used in the software architecture and ‘lead developer’ community for component based development
  - UML ‘Profiles’ are used to customize UML to a specific domain
- UML 1.0 became a standard in 1997 and unified several leading OO modeling notations (Booch, Rumbaugh, Jacobson, Mellor....) – UML 2.0 was just adopted
- The UML metamodel (model of UML) is defined using a meta language called Meta Object Facility & using UML notation
- UML models are serialized as XML documents based on UML 1.4 DTD or UML 2.0 XSD
  - XML Metadata Interchange (XMI) provides design patterns that automate model and metadata serialization
- UML, MOF, XMI are OMG MDA standards

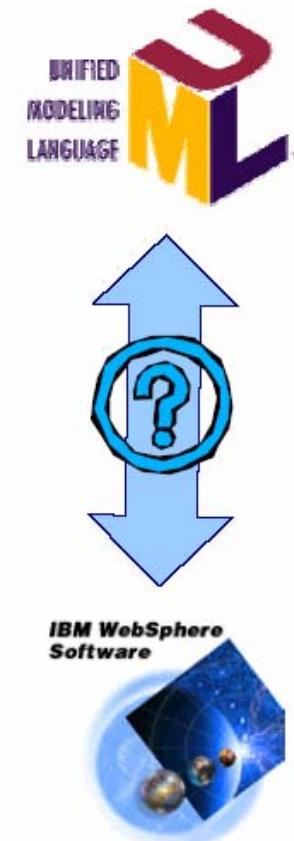

# *Why map UML to BPEL4WS?*

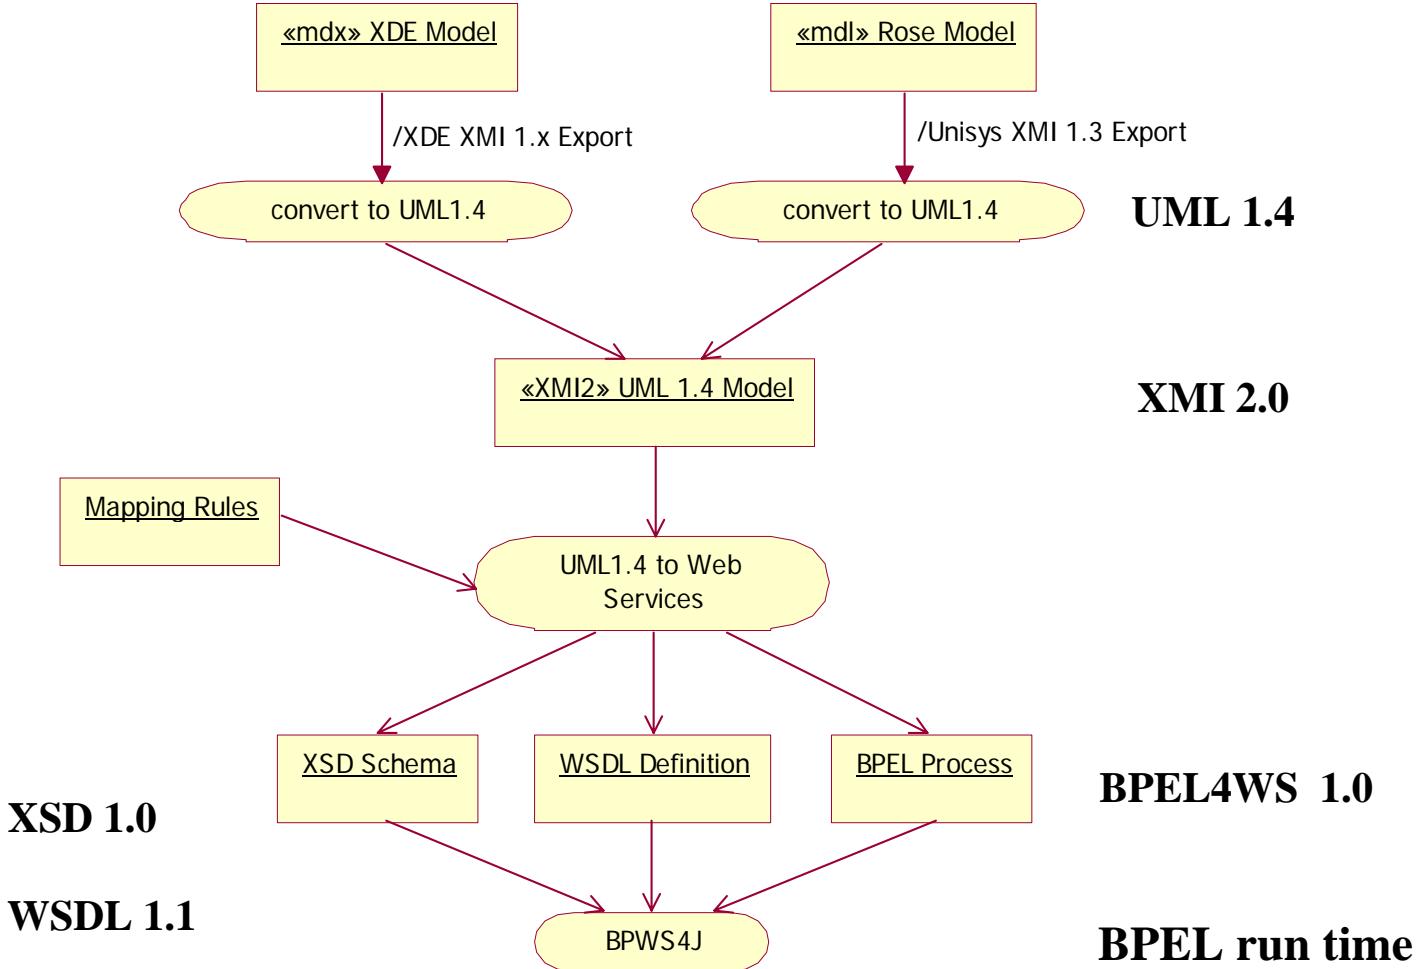

## UML to BPEL4WS

- UML is a widely used, standard modelling language for software design with a visual notation.
- BPEL4WS is a language for specifying business processes which can be executed on a BPEL4WS runtime
- **Goal: Support automated mapping from (a profile of) UML to BPEL4WS**

A profile is a customization of UML for modelling in a particular context.

# *'Business Integration Profile' using MDA and Web Services*

# *Profile Principles*

- The profile should cover broadly the same set of concepts as BPEL
- Support the concepts of XSD and WSDL that are required to support BPEL, but don't cover the whole of service oriented architecture in this profile
- Standard UML terminology for concepts is used where available, e.g. Interface rather than PortType
- Where UML 2 will have more direct support for concepts then the profile adopts a UML 2 style (e.g. introducing a notion of ports)
- In areas of UML that are better defined in UML 2 then the UML 2 semantics is assumed
- It should be possible to create models conforming to the profile using multiple UML editors, specifically Rose and XDE

# *Purchase Order (PO) Process*

- Customer sends purchase order to purchase service provided by PO process
- PO process asks for initial price, shipping information, and production schedule
- Shipping requestor determines where order items will be obtained and creates source and destination shipping information
- When price and shipping information are available, invoice provider calculates final price and sends invoice to PO process
- The PO process asks a scheduling provider to determine when each order item will be produced and instructs the scheduling provider to send a schedule to the customer
- Finally, the PO process replies to the customer with an invoice

# *The PO Process in BPEL4WS*

A BPEL  
'program'

state

interaction  
points

behaviour

```
<process name="purchaseOrderProcess" ...>

    <containers>
        <container name="PO" messageType="lns:POMessage"/>
        <container name="Invoice" messageType="lns:InvMessage"/>
        ...
    </containers>

    <partners>
        <partner name="customer" serviceLinkType="lns:purchaseLT"
            myRole="purchaseService"/>
        ...
    </partners>

    <sequence>
        <receive partner="customer"
            portType="lns:purchaseOrderPT"
            operation="sendPurchaseOrder"
            container="PO">
        </receive>
        ...
        <reply partner="customer" portType="lns:purchasePT"
            operation="sendPurchaseOrder"
            container="Invoice"/>
    </sequence>

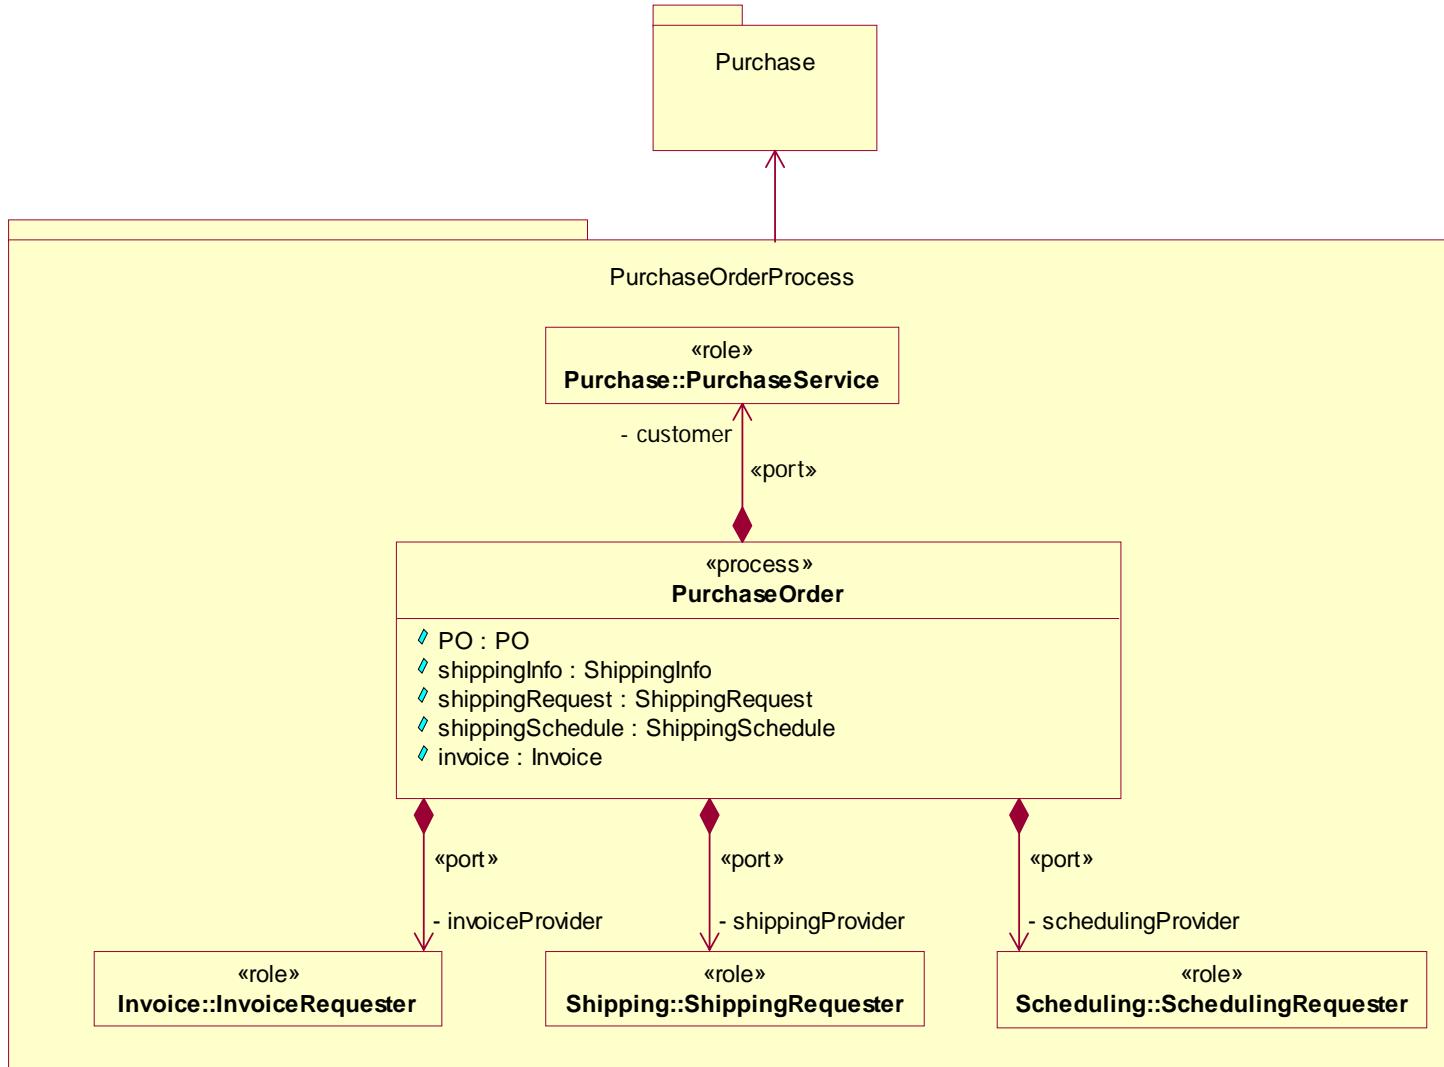

</process>
```

# *BPEL Process as a Process Component & BPEL partners as ports – UML 2.0*

- This is the UML 2 version, we approximate this in UML 1.4 (more detail later)

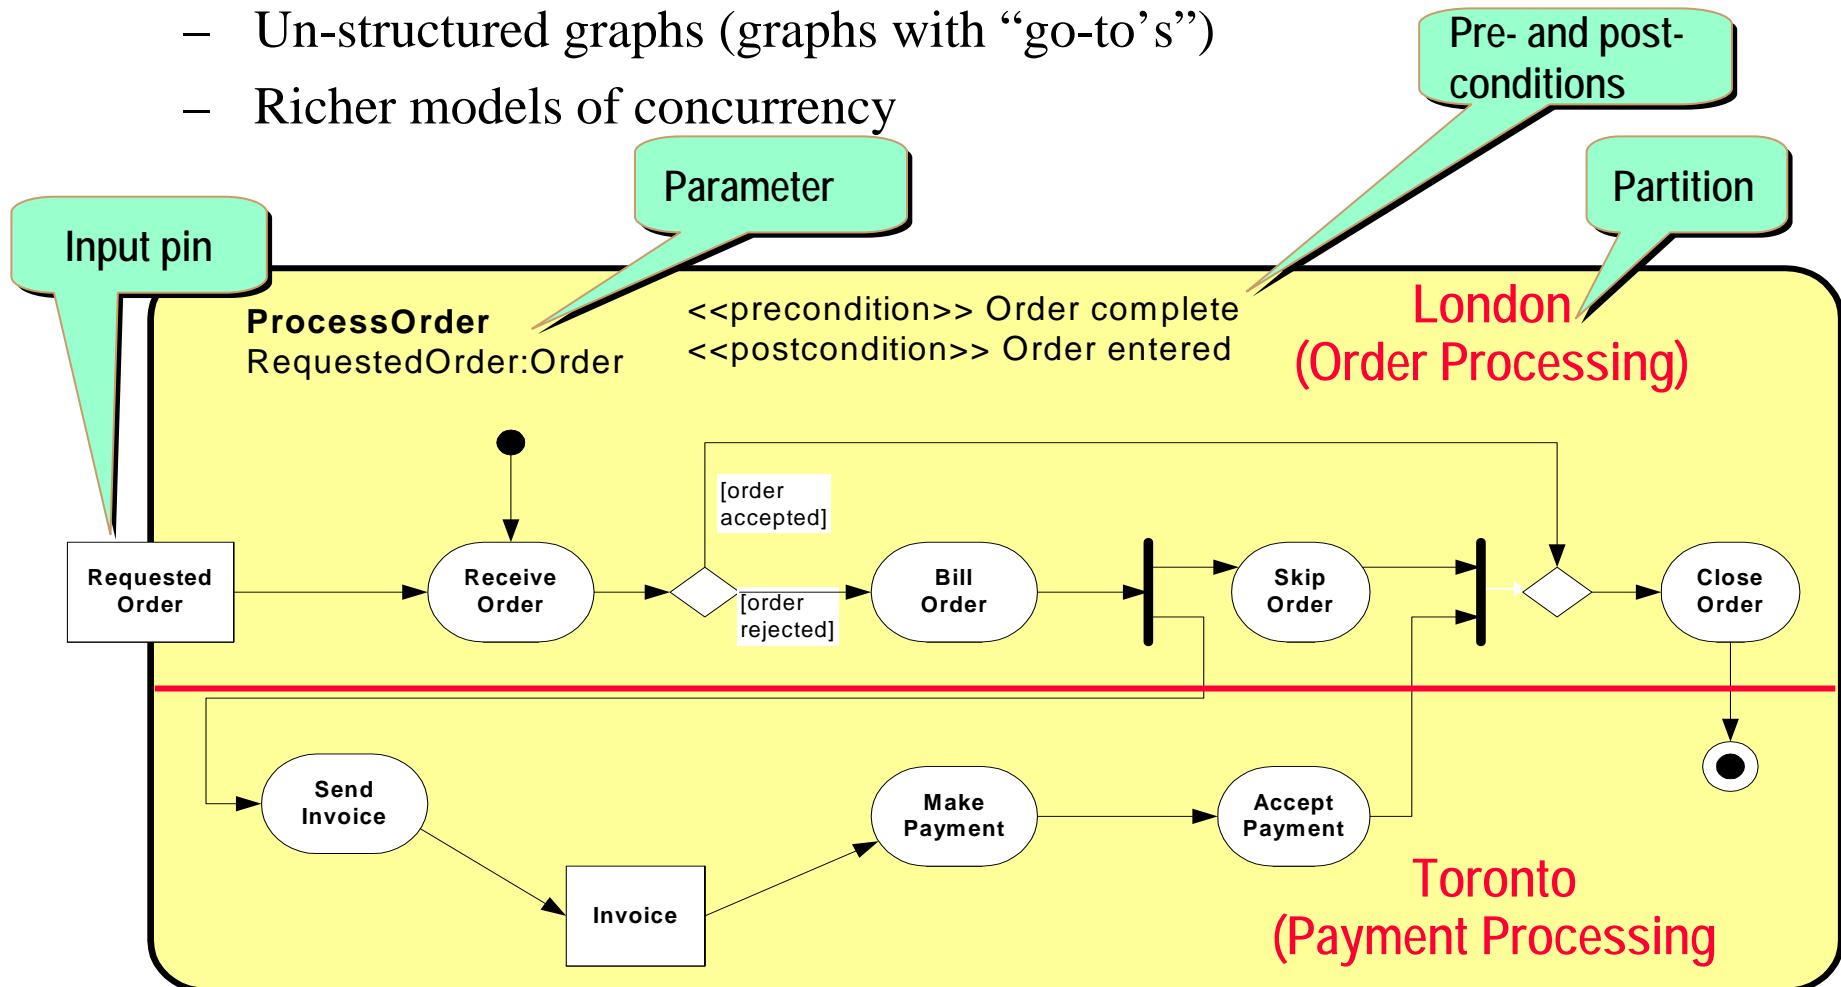

# *BPEL Partners as Ports – UML 1.4*

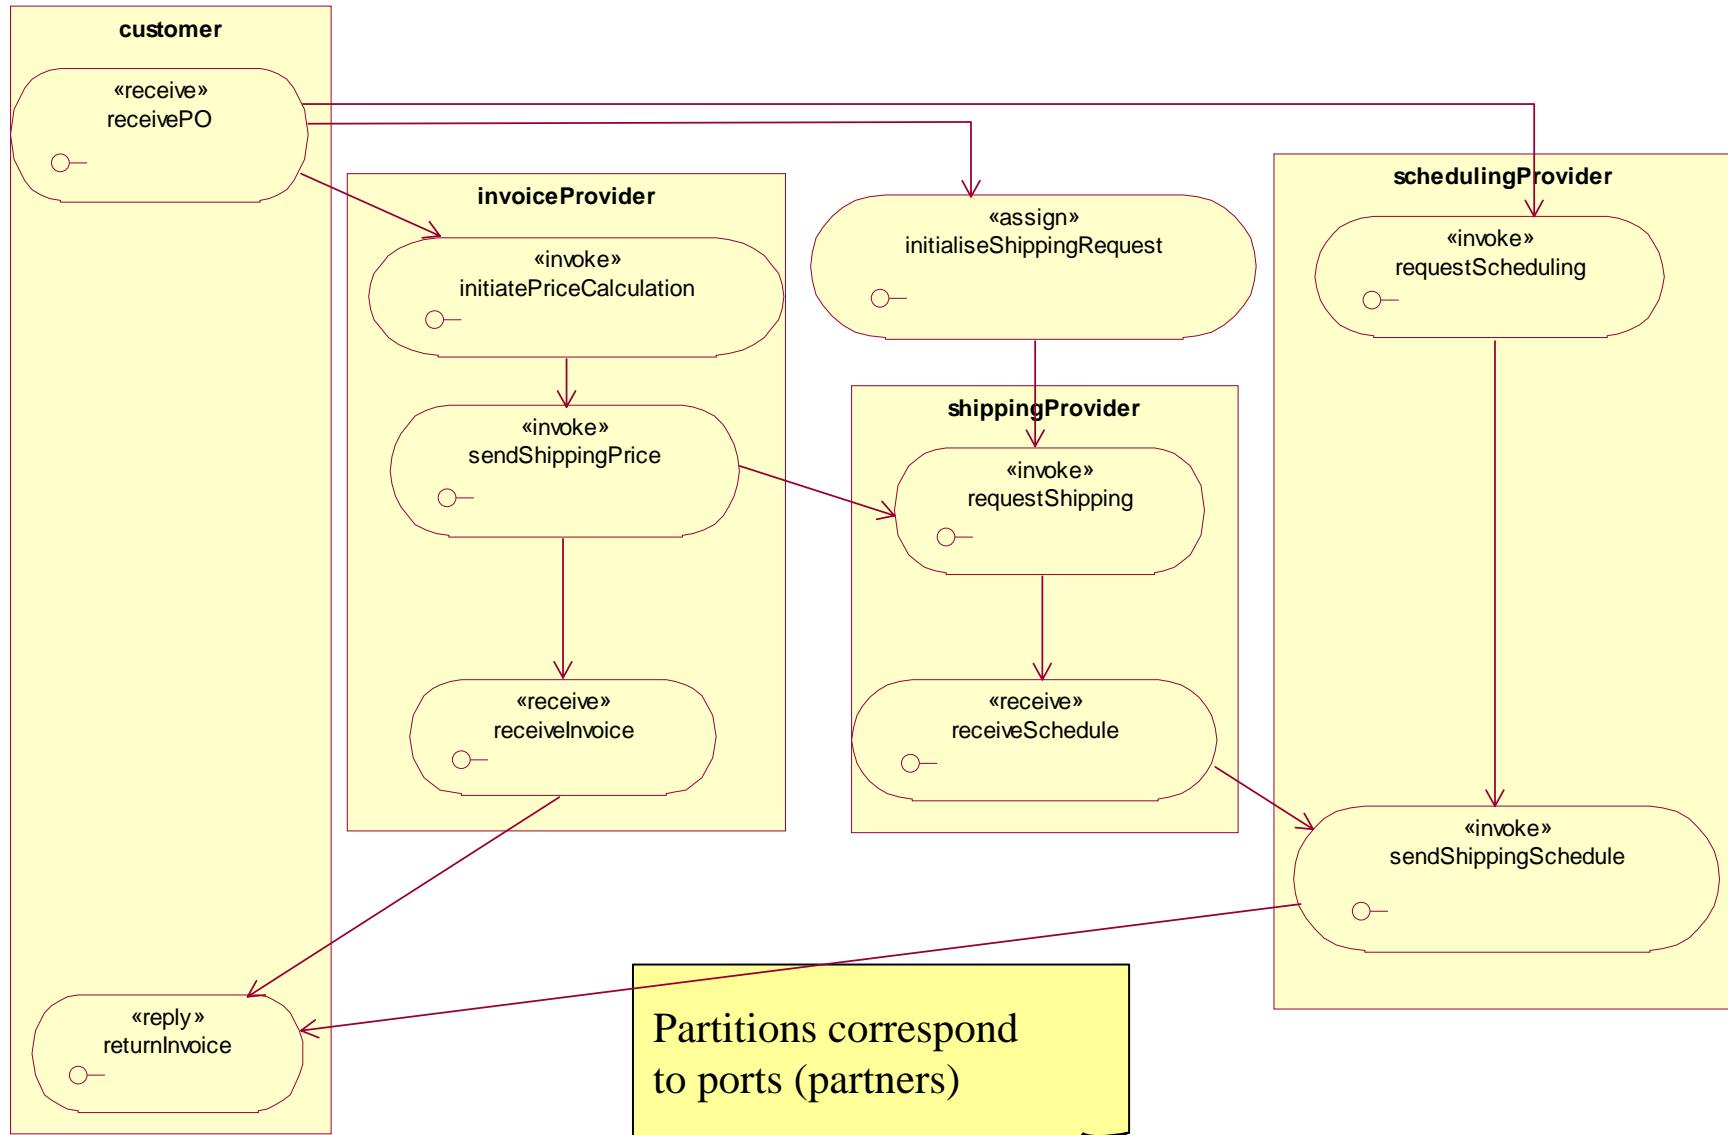

# UML2 Activities: New Semantic Foundation

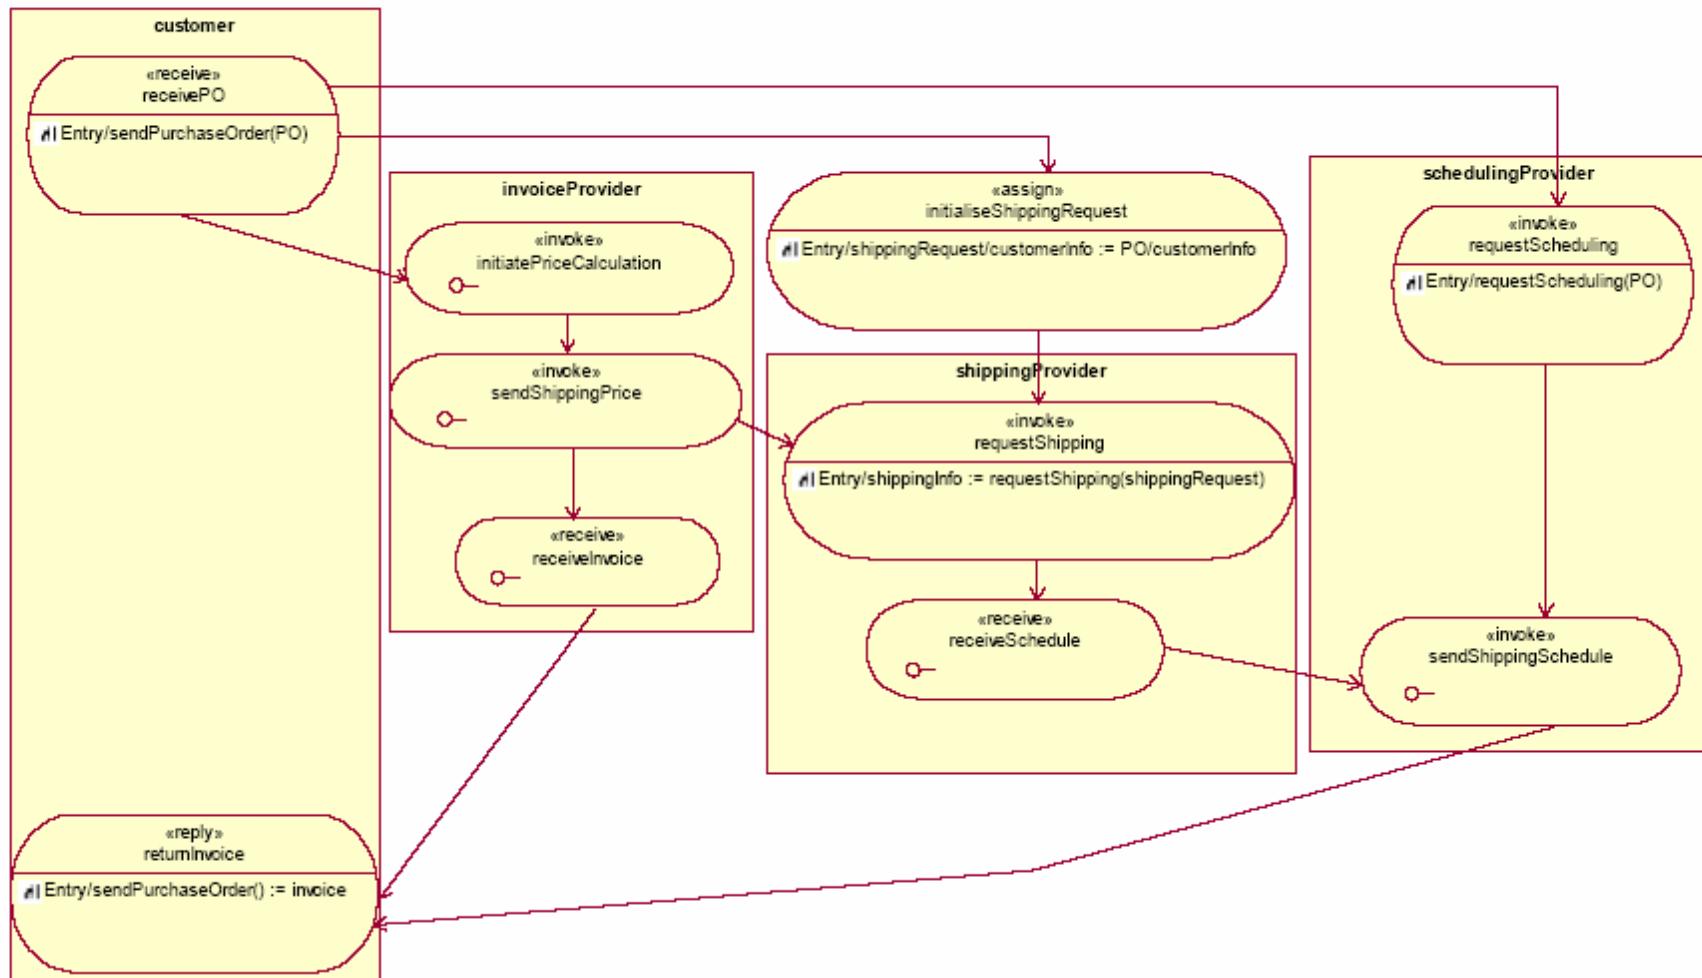

- Petri Net-like foundation (vs. statecharts) enables
  - Un-structured graphs (graphs with “go-to’s”)
  - Richer models of concurrency

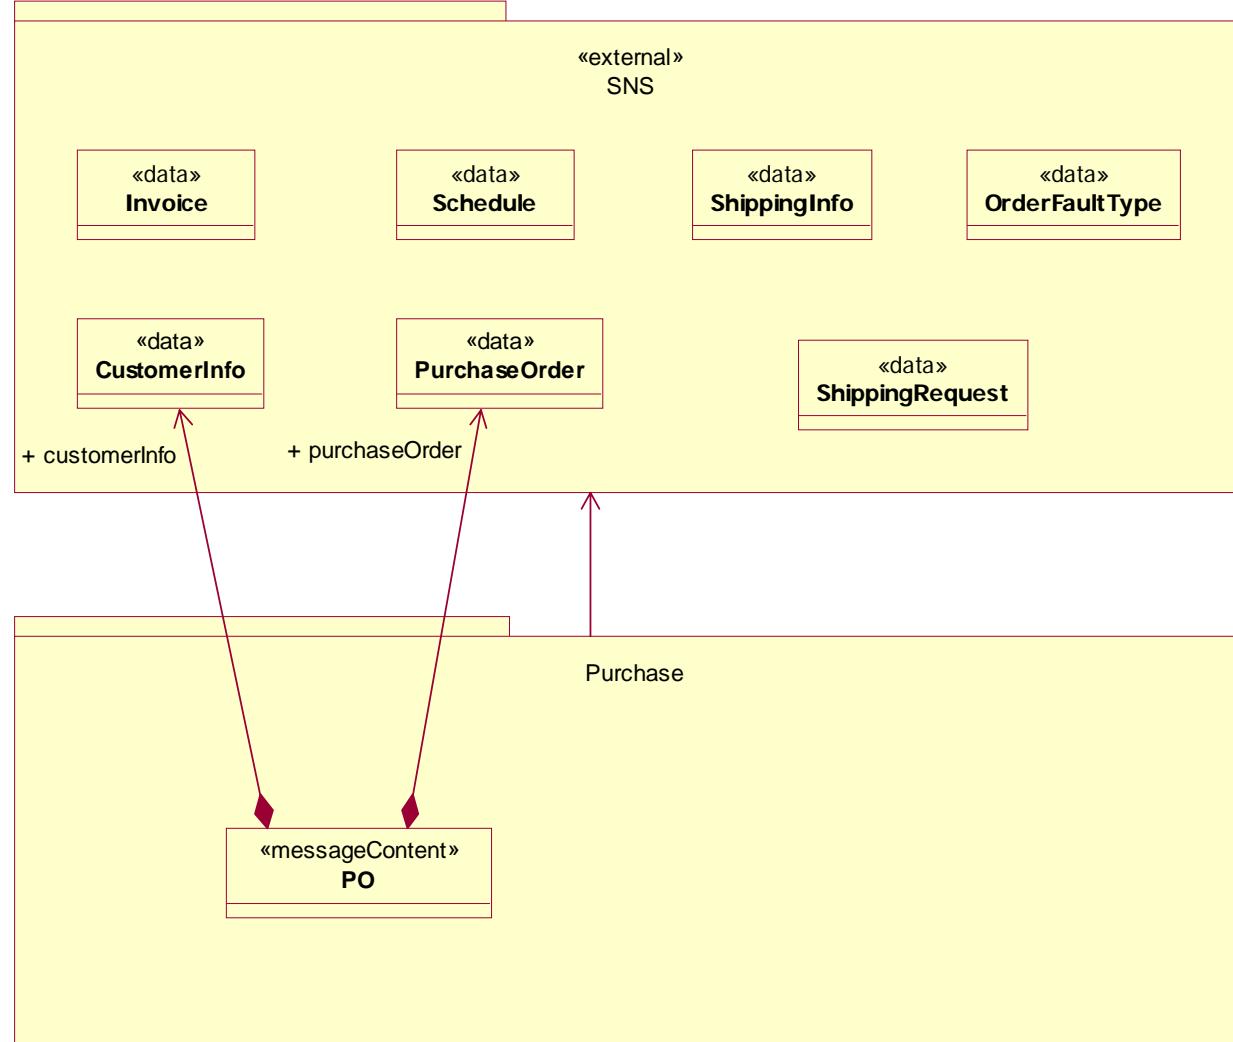

# Purchase Order Process

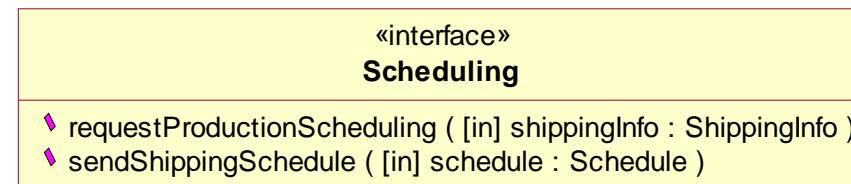

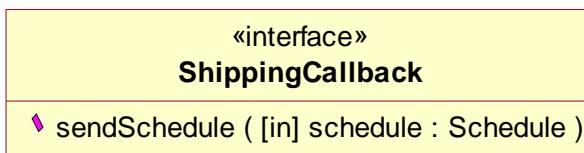

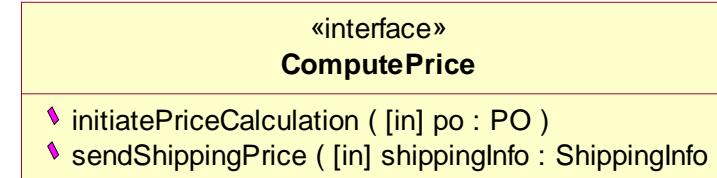

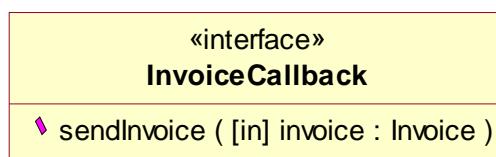

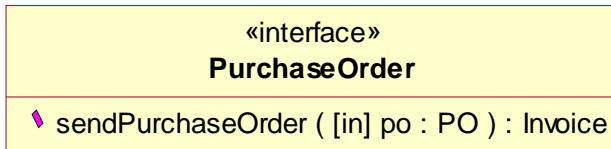

# Purchase Order Process – Detailed Behaviour

# Data and Message Types

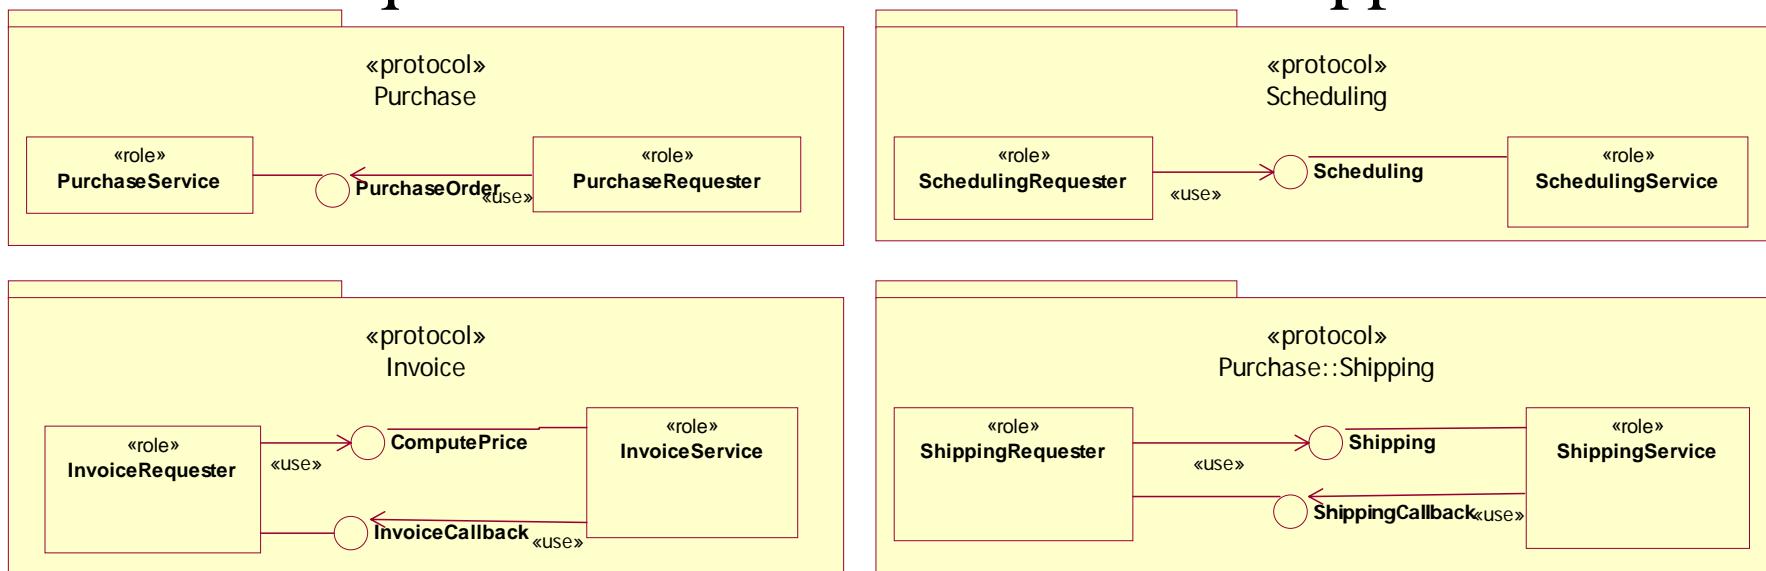

# *Interfaces*

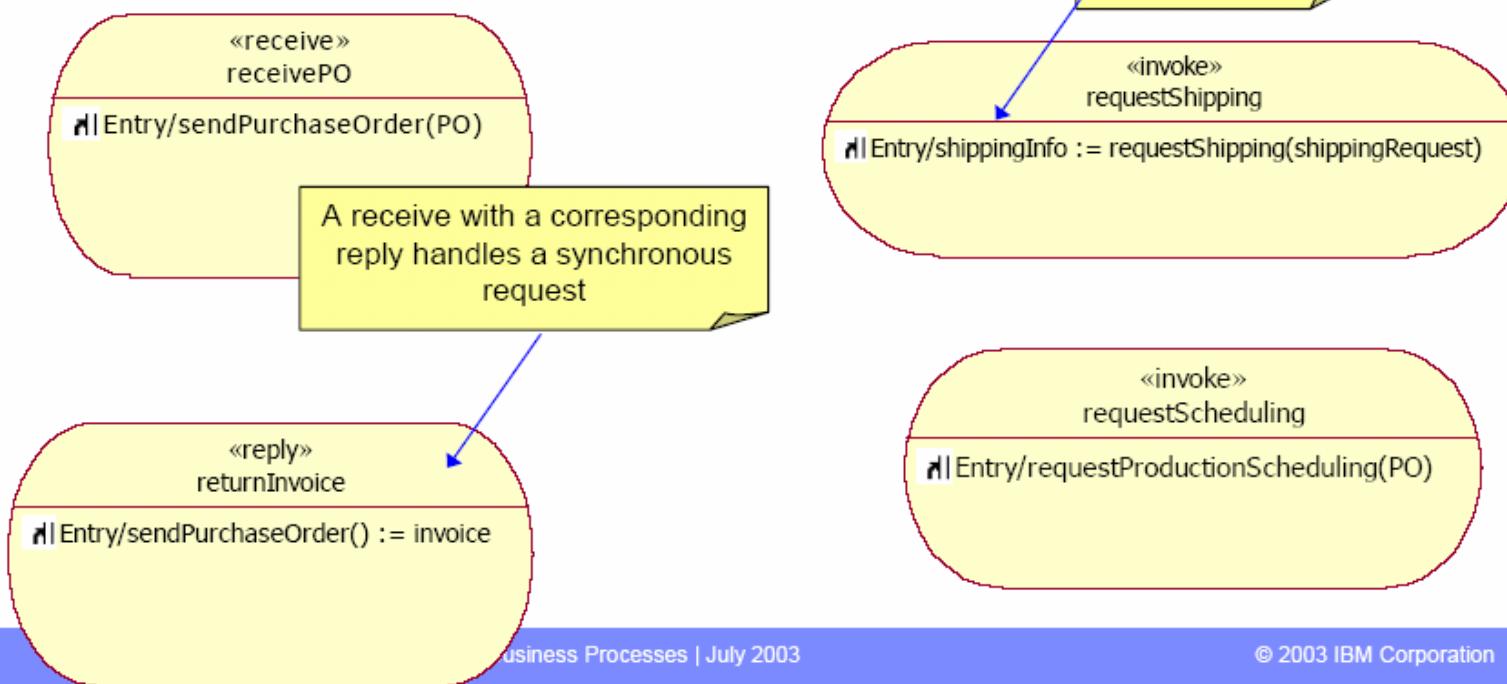

# Protocols

- Protocols are defined independently of the processes that use them
- Roles provide ‘port types’ – groupings of provided and required interfaces that must be supported

## Basic Interactions

- Action syntax based on XPATH which BPEL uses as its default expression language

# *Mapping: Process*

```
<process
    abstractProcess="no"
    containerAccessSerializable="no"
    enableInstanceCompensation="no"
    name="LoanApproval"
    suppressJoinFailure="yes"
    targetNamespace="http://www.bpel-examples.ibm.com/
LoanApproval/LoanApprovalProcess/LoanApproval.bpel">
    ...
<containers>
    <container messageType="LoanDefinitions:CreditInformation"
        name="request" />
    <container messageType="LoanAssessor:RiskAssessmentDetails"
        name="riskAssessment" />
    <container messageType="LoanApprover:Approval"
        name="approvalInfo" />
    <container messageType="LoanDefinitions:LoanRequestError"
        name="error" />
</containers>
...
</process>
```

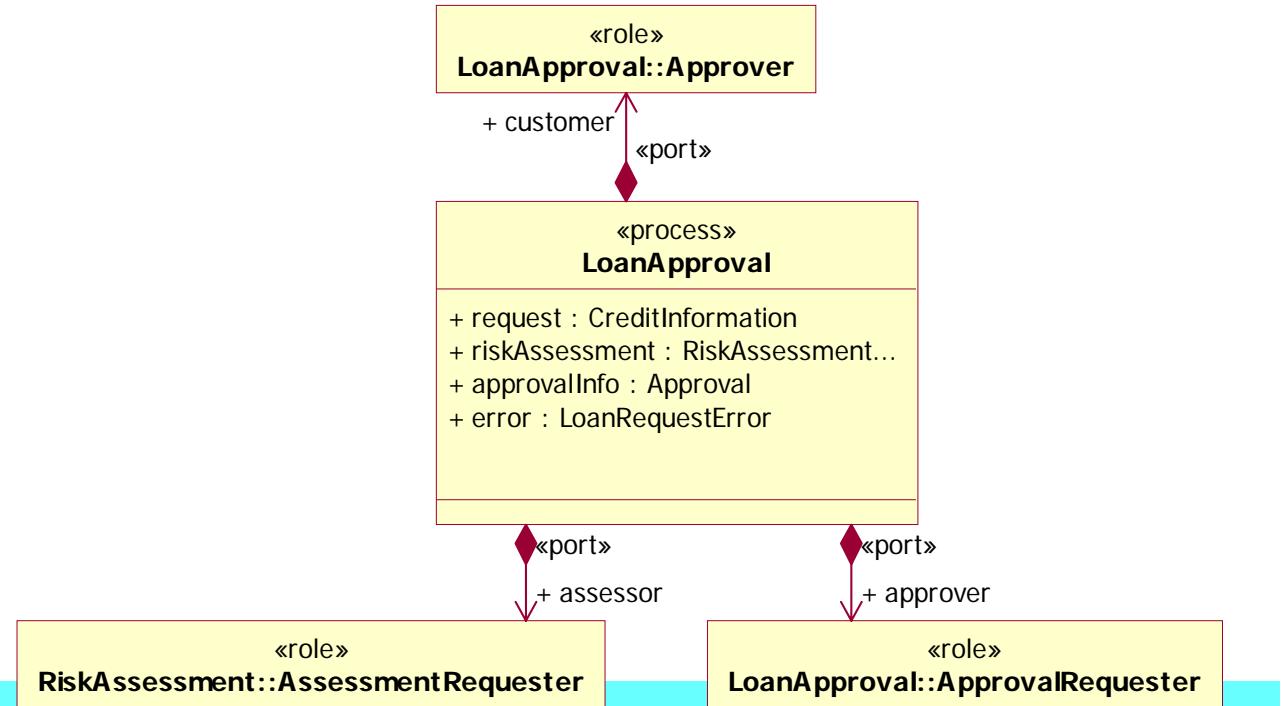

«process»

**LoanApprovalProcess::LoanApproval**

+ request : CreditInformation  
+ riskAssessment : RiskAssessmentDetails  
+ approvalInfo : Approval  
+ error : LoanRequestError

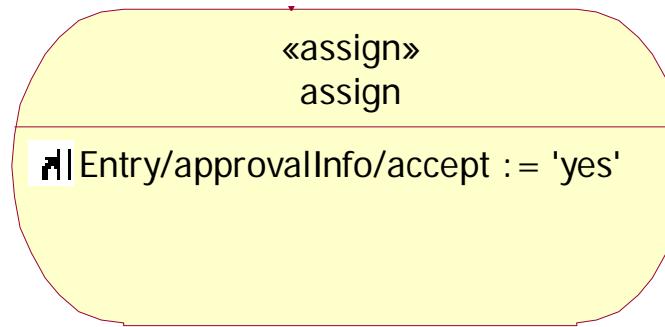

# Mapping: Partners

```
<partners>
    <partner myRole="Approver" name="customer"
        serviceLinkType="LoanApprovalProtocols:LoanApproval" />
    <partner name="approver" partnerRole="Approver"
        serviceLinkType="LoanApprovalProtocols:LoanApproval" />
    <partner name="assessor" partnerRole="Assessor"
        serviceLinkType="LoanApprovalProtocols:RiskAssessment" />
</partners>
```

# *Mapping: Assign Activities*

```
<assign name="assign">
  <copy>
    <from expression=" 'yes' " />
    <to container="approvalInfo" part="accept" />
  </copy>
</assign>
```

# BPEL Mapping Overview

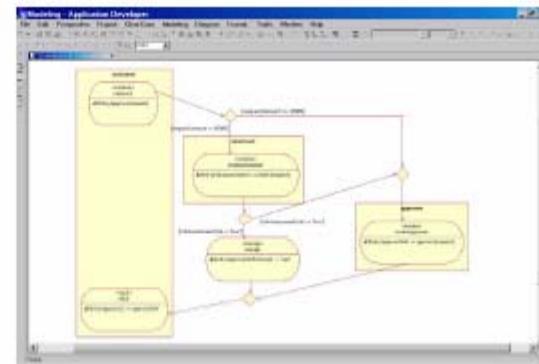

<<process>> class	BPEL process definition
Activity graph on a <<process>> class	BPEL activity hierarchy
<<port>> associations	BPEL partner declarations
<<process>> class attributes	BPEL containers
Hierarchical structure and control flow	BPEL sequence and flow activities
Decision nodes	BPEL switch activities and transition conditions
<<receive>>, <<reply>>, <<invoke>> activities	BPEL receive, reply, invoke activities
<<protocol>> package with <<role>> classes	BPEL service links types and roles

## UML to BPEL alphaWorks Demo

- Part of the Emerging Technologies Toolkit
- Available now
- Supports an end-to-end scenario: Loan Approval
- Version supporting full forward generation from user-defined models coming in July 2003

# UML to BPEL Mapping model

# *UML2BPEL Components – All these are EMF based Eclipse plug-ins!*

- Eclipse infrastructure : [www.eclipse.org](http://www.eclipse.org)
- EMF component : [www.eclipse.org/emf](http://www.eclipse.org/emf)
- XSD component : [www.eclipse.org/xsd](http://www.eclipse.org/xsd)
- BPEL component : Internal IBM metamodel (for tools) and BPEL engine (BPWS4J)
- Will use UML2 component : [www.eclipse.org/uml2](http://www.eclipse.org/uml2)
  - The proof of concept of EMF UML 1.4 implementation was a precursor to the current UML2 project
- WSDL component : Internal IBM metamodel
- UML2BPEL mapping component : Internal IBM metamodel component (mapping component)

# *UML2BPEL has been Submitted to OMG ( IBM, Unisys, BEA... )*

# *Modeling for Web Services - Recap*

- UML, MOF and XMI can be used as-is to model & manage Web Services
  - Web Service Operations (WSDL Operations) are UML Operations
  - Groups of Web Service structures Requests (WSDL Ports) as UML Interfaces or Classes
  - XML Schemas using UML Class Diagrams
  - Web Services data structures using UML Class Diagrams
  - Web Services flow (E.g.:BPEL4WS) using UML Activity Diagrams
- But some standard transformations, UML profiles etc, would be useful to enable tools interoperability
  - <http://www.omg.org> (MOF, XMI, UML and CWM specs)
  - XMI - Mappings from MOF/UML to XML DTD, XML Schema
  - Modeling XML applications with UML by David Carlson
    - <http://www.xmlmodeling.com>
  - UML to BPEL mappings (UML profile for BPEL) - Proposed standard
  - OMG Business Process Definition Metamodel RFP
  - OMG Business Rules RFP Drafts : Rule Expression Language, Rule Management...

## Conclusions

- The experiences of modelling with UML can be applied to the development of systems that will be deployed using emerging web services standards
- It is possible to specify a profile of UML with sufficient detail that it can be translated automatically to a language such as BPEL4WS
- The approach provides an integration mechanism for multiple standards and specifications which need to be used to build a complex solution

This is especially relevant in business integration scenarios

**IBM will integrate its tools portfolio using a set of shared Metamodels and Profiles based on the Eclipse platform (as plug-ins)  
The UML 2.0, XSD, WSDL, BPEL4WS and related transformations  
are an integral part of our software development platform**

# *Wrap Up*

- Most customers have and will continue to have components and information/data from multiple sources and formats that need integration
- Web Services promise to be a key enabler for application integration and business process integration
  - Embraced by all industry players
  - Pragmatic loosely coupled integration
  - Promise of ubiquitous availability
  - Modeling and Web Services on a convergence path
    - OMG MDA, OASIS ebXML UMM, BPMN
- Model Driven Architecture enables architects, designers and developers to use models and metadata with web services and existing technologies with a focus on full life cycle architecture
- Web Services standards (like other standards!) will come and go, but some of the business models and processes will be more lasting (manage and protect your models and metadata)
- Use models to communicate, understand, analyze and design, use metadata to integrate flexibly within an architectural context

# *Backup*

# *Tool Integration across Modeling & Web Service Tools – How are we doing it?*

- Use Eclipse tools integration framework
  - [www.eclipse.org](http://www.eclipse.org) (Java IDE, tools integration framework)
- Use Eclipse EMF for modeling & metadata management
  - [www.eclipse.org/emf](http://www.eclipse.org/emf), [www.eclipse.org/xsd](http://www.eclipse.org/xsd)
  - Simplification of OMG MOF 1.4 with support for XMI 2.0
  - Use UML models, XMI, XSD or Annotated Java as metamodel input
  - Code generation for metadata interfaces and implementation
  - XML Serialization, XSD generation. Support for MOF2 soon
- Used in IBM WebSphere Studio & in WebSphere Application Server (ex: configuration metadata), Rational, Borland..
- Expect the usage to increase across software development lifecycle
  - UML modeling, testing, software quality improvement...
  - UML2 open source project launched : [www.eclipse.org/uml2](http://www.eclipse.org/uml2)
  - IBM Research area : ‘Model Driven Business Integration’

# *OMG Model Driven Architecture*

\* In R&D

# ***EMF Ecore Model***

## *([www.eclipse.org/emf](http://www.eclipse.org/emf))*

# EMF::Ecore Details

# *Using MDA to execute the Mapping*

- Start with EMF models of UML, XML Schema, WSDL, and BPEL
- Use EMF to generate Java APIs for all the EMF models
  - Each model uses a serializer for its preferred external representation
- Create an EMF model of the mapping between UML and the Web Services components
- Use EMF to generate an API for the model-to-model mapping
- Implement the methods to map between source and target models
- Can be deployed as an Eclipse builder, no user input required to do the mappings
