

# Model-Driven Business Process Platforms

## The Path to Enterprise SOA

**David S. Frankel**

**Lead Standards Architect – Model Driven Systems**

**SAP Labs**

## Last-generation value proposition

- Applications embody well-validated, accepted business processes

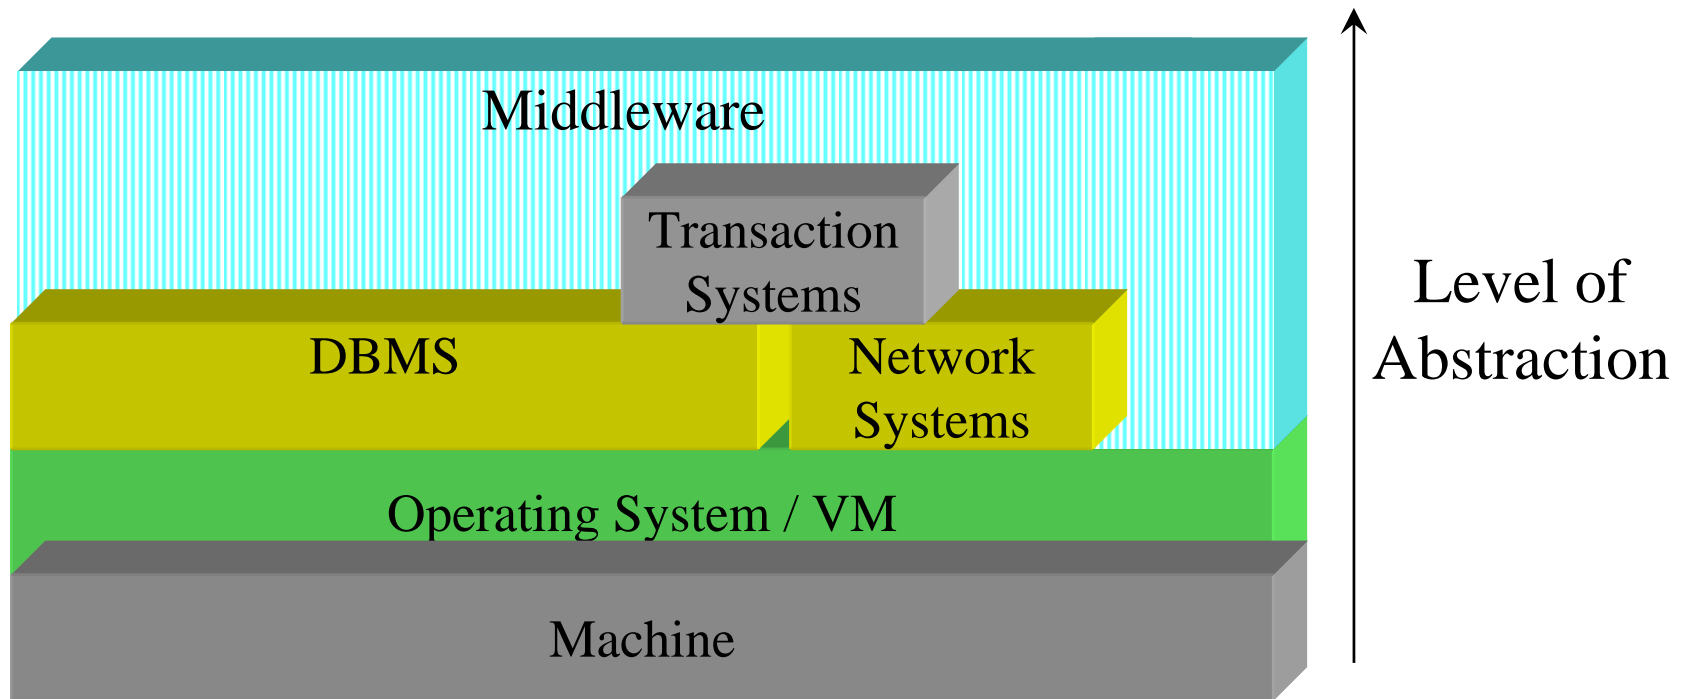

## Next-generation business reality

- Innovative business model and associated processes define an enterprise's competitive advantage
  - ◆ Not enough to have a great product
  - ◆ Must also have a great business model
- Not attractive to simply follow a business process defined elsewhere
- Outsourcing all but core business processes
- Need flexibility in designing and executing innovative business processes
  - ◆ Core business processes
  - ◆ Value Chains / Value Networks for accessing mission-critical, non-core processes

# The Technical Platform Stack

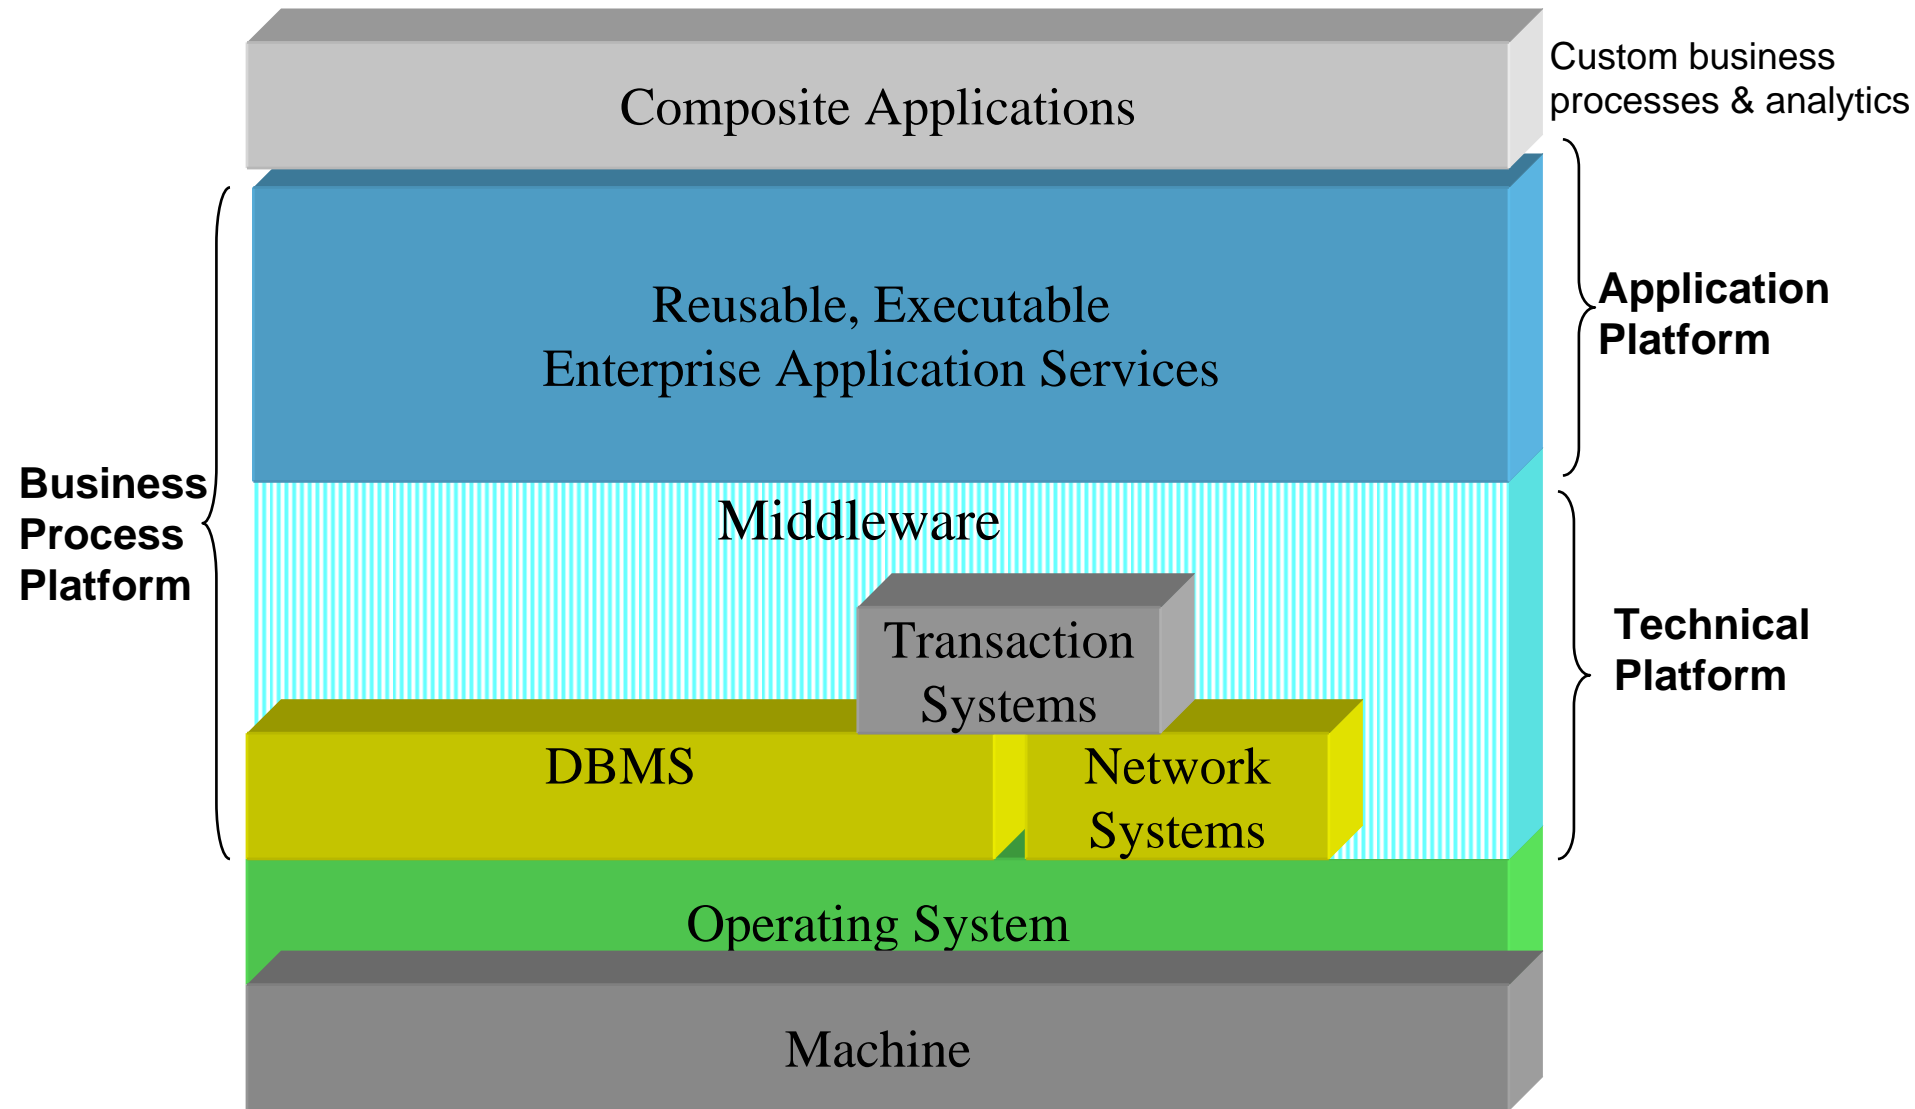

Means A depends on B

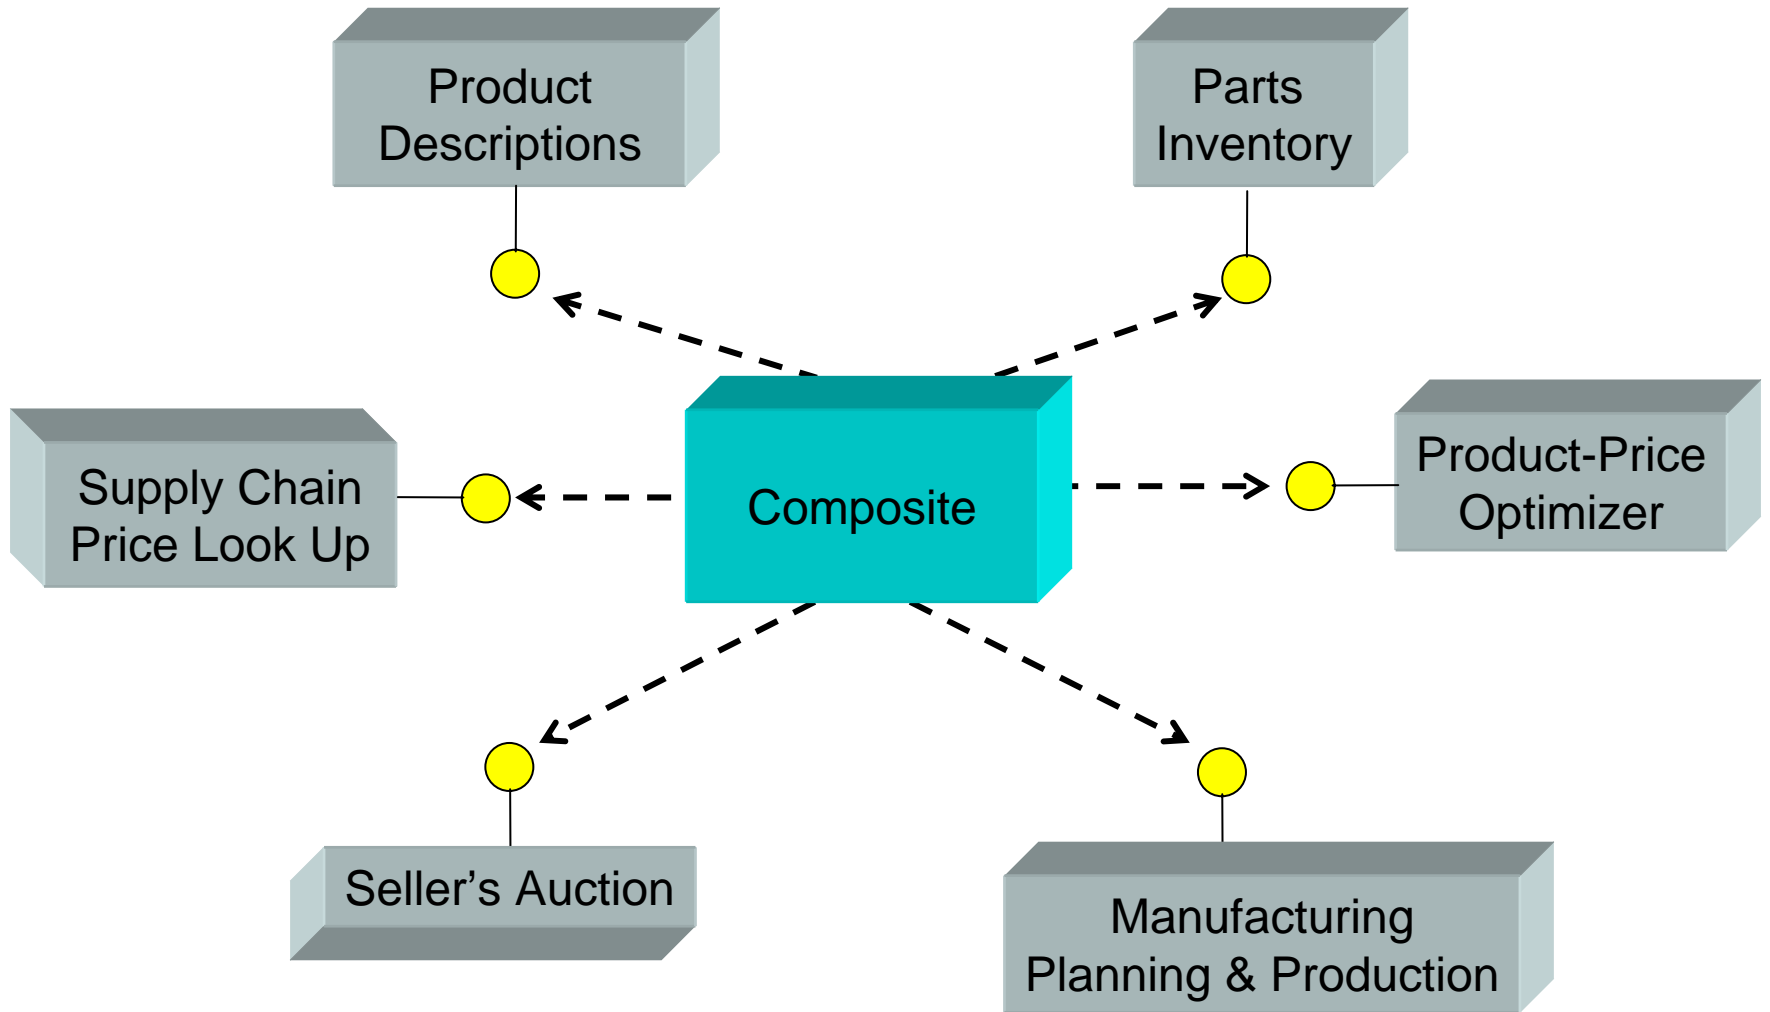

# Business Process Platform

## Raising the Abstraction Level of the Software Platform

# Composite App: Procure-to-Pay, Order-to-Cash, Manufacture-to-Inventory

David Burdett, SAP Labs

--> = Invoke

# Model Compilers and the Abstraction Level

Application Model

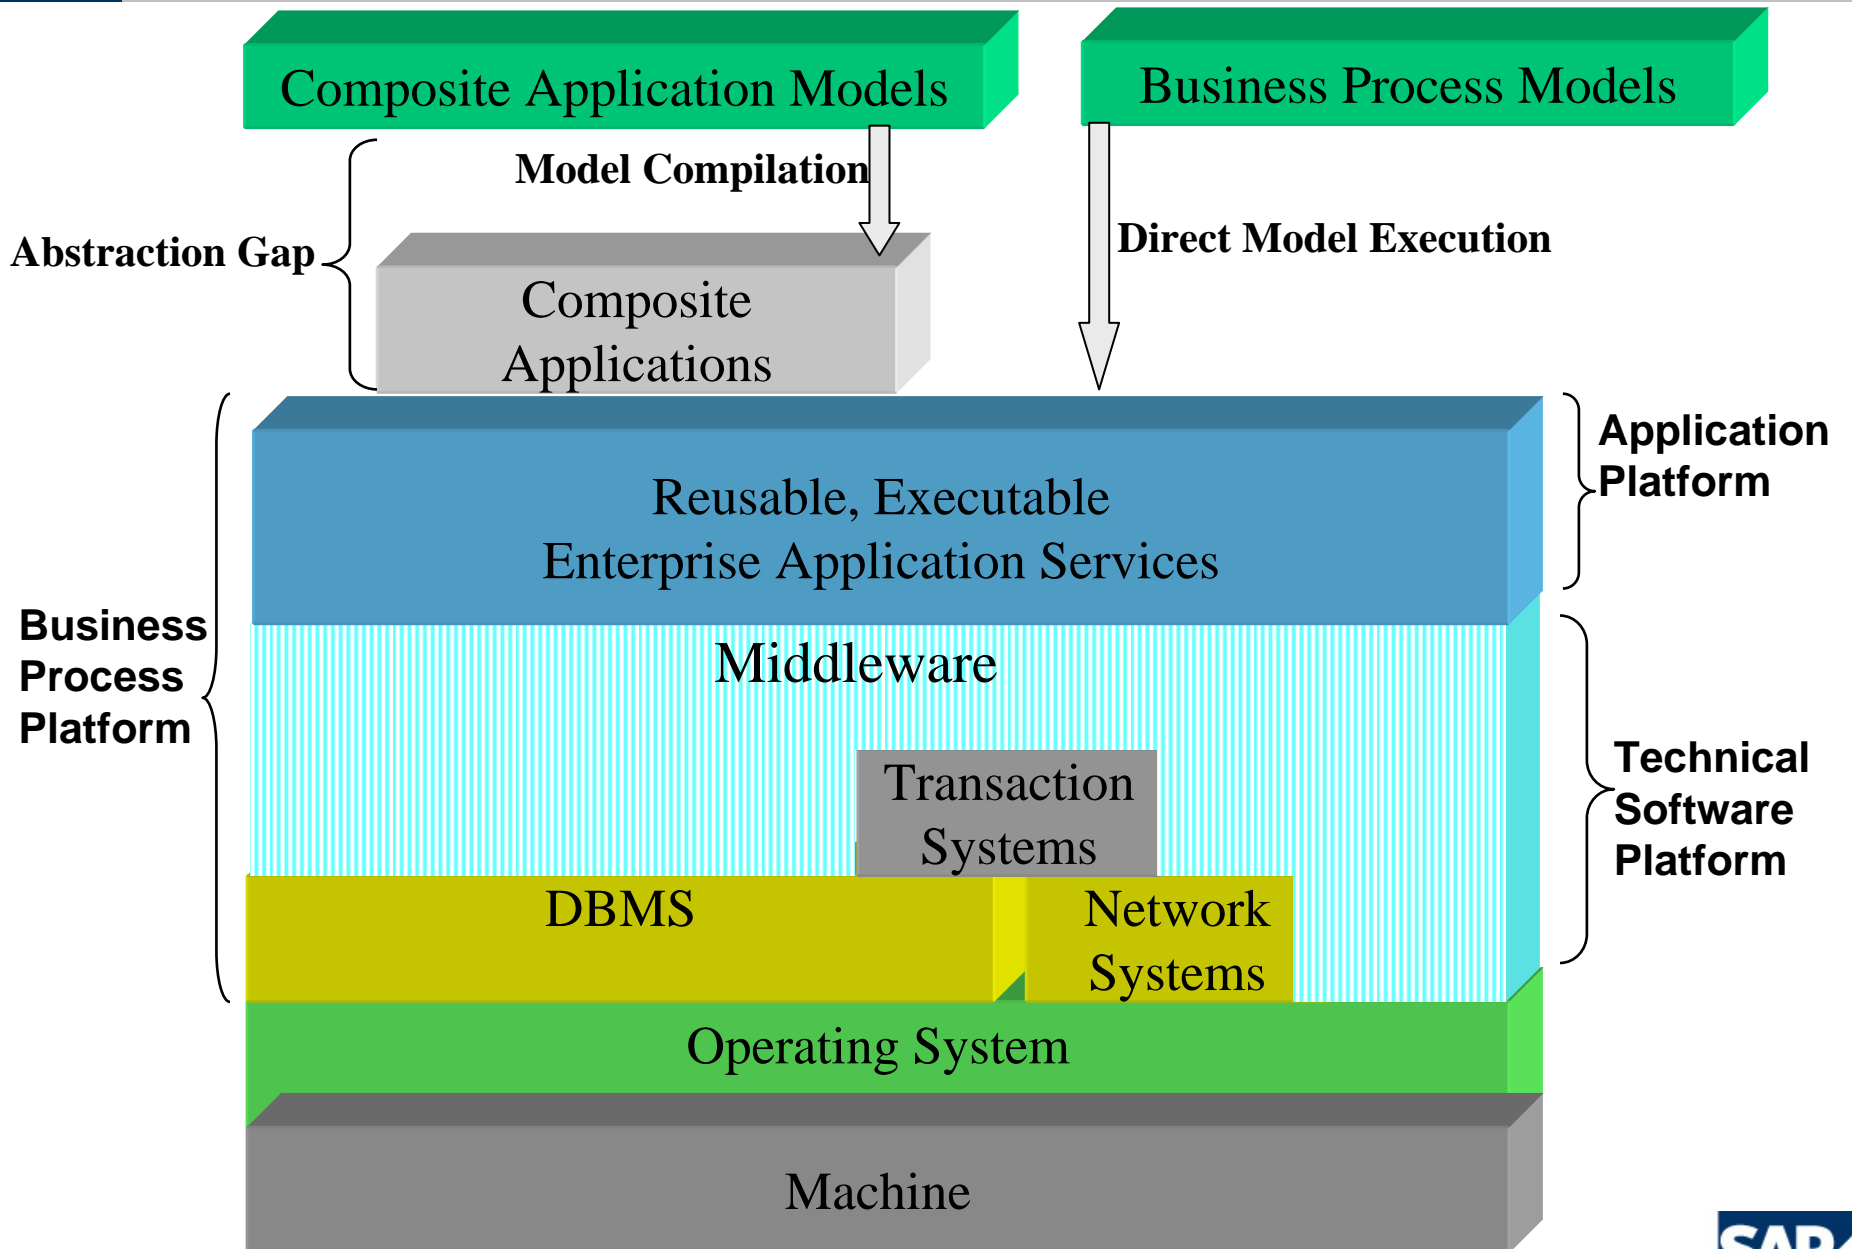

Model Compilation

Abstraction Gap

Level of Abstraction

# Model-Driven Tools Empowering the Business Process Expert (BPX)

**This jump in the platform abstraction level is more difficult than the last jump (middleware)**

- **Just as raising the abstraction level for development languages above 3GLs is more difficult than the last jump to 3GLs**

**Crawl, Walk, Run**

- **Provide business value at every step**

## **Semantically thin specifications reach their limits**

- **How do you achieve semantic interoperability on top of syntactic interoperability?**
  - ◆ Do collaborating parties have a common understanding the contract of a service?
  - ◆ You can't rely on informal conversations among people
  - ◆ The parties might have different human languages as native tongues
- **How do you find suitable services to compose?**
  - ◆ Suitable functional behavior
  - ◆ Suitable quality of service

## **Configuration/version/dependency management problems do not go away**

- **They can even get worse**

## Need a metadata-rich environment to *assist* humans using the business process platform

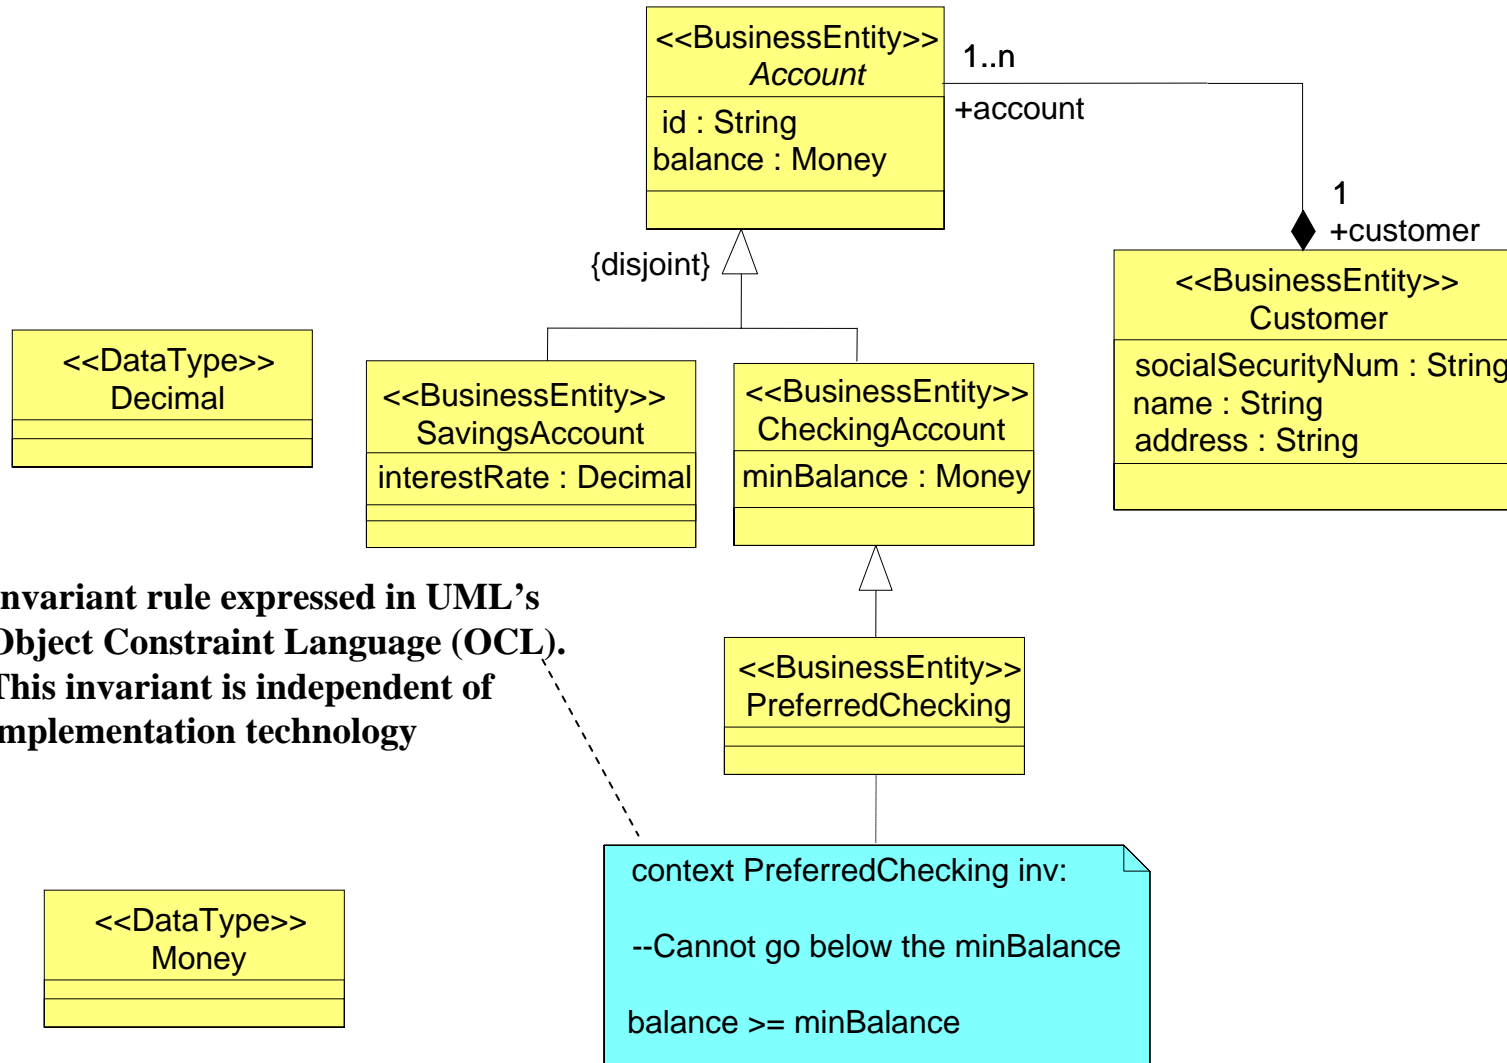

### ■ Specifying Constraints

- ◆ Service message/data types specified as precisely as possible
  - Invariants
- ◆ Service operations functional contract specified as precisely as possible
  - Preconditions and postconditions (more numerous than invariants)
- ◆ Using machine-readable, declarative constraint languages
- ◆ We've know how to do this for decades
- ◆ Also improves quality
- ◆ Also need to learn to specify QoS requirements and capabilities as precisely as possible

### ■ Inferences identify candidates or flag potential problem combinations

- ◆ *Inferences do not have to be 100% certain to be helpful*
- ◆ Let the human decide what to do
- ◆ Record what the human decides
- ◆ Show the next human what the others decided
- ◆ Learn
- ◆ Inference engines require languages for expressing metadata to be *formally grounded*

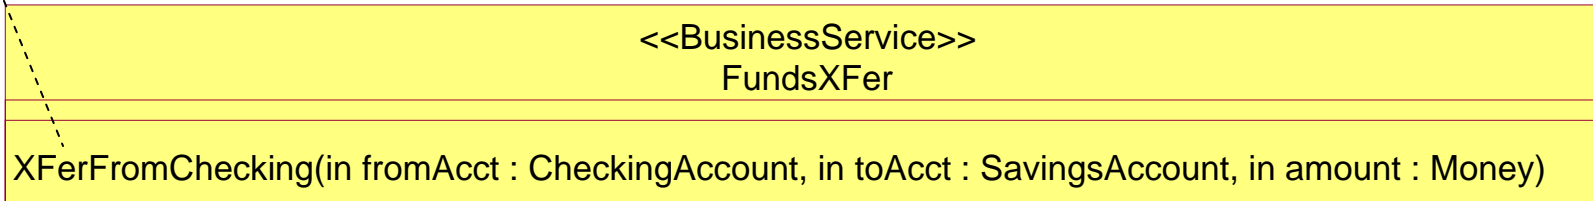

# Abstract Business Information Model: IT Viewpoint With an Invariant Rule

# Abstract Model of a Business Service

## With Pre-conditions and Post-Conditions

### Signature

```
context FundsXFer::XFerFromChecking (fromAcct : CheckingAccount, toAcct : SavingsAccount amount : Money) : void
pre:
--There must be sufficient funds in the checking account to support the transfer
fromAcct.balance >= amount
pre:
--The checking account and the savings account must belong to the same customer
fromAccount.customer = toAcct.customer
post:
--The balance of the checking account is reduced from its original amount by the amount of the transfer
fromAcct.balance = fromAcct.balance@pre - amount
post:
--The balance of the savings account is increased from its original amount by the amount of the transfer
toAcct.balance = toAcct.balance@pre + amount
```

**Pre/post conditions—Independent of implementation technology**

## Operative business rule

■ If the drop-off location of a rental is not the EU-Rent site of the return branch of the rental then it is obligatory that the rental incurs a location penalty charge.

## Supporting fact types

- rental has drop-off location
- rental has return branch
- branch is located at EU-Rent site
- rental incurs location penalty charge

Adapted from Semantics of Business Vocabulary and Business Rules, OMG document dtc/06-03-02

## Constraints having to do with a component's design-time or deployment-time configuration parameters

- The value of one configuration parameter may constrain the values of others
- Tools can enforce these kinds of constraints, with some limitations
- Tools can also detect collisions among configuration constraints that would result from specific combinations of components
  - ◆ Sometimes detection is certain and sometimes only suspected

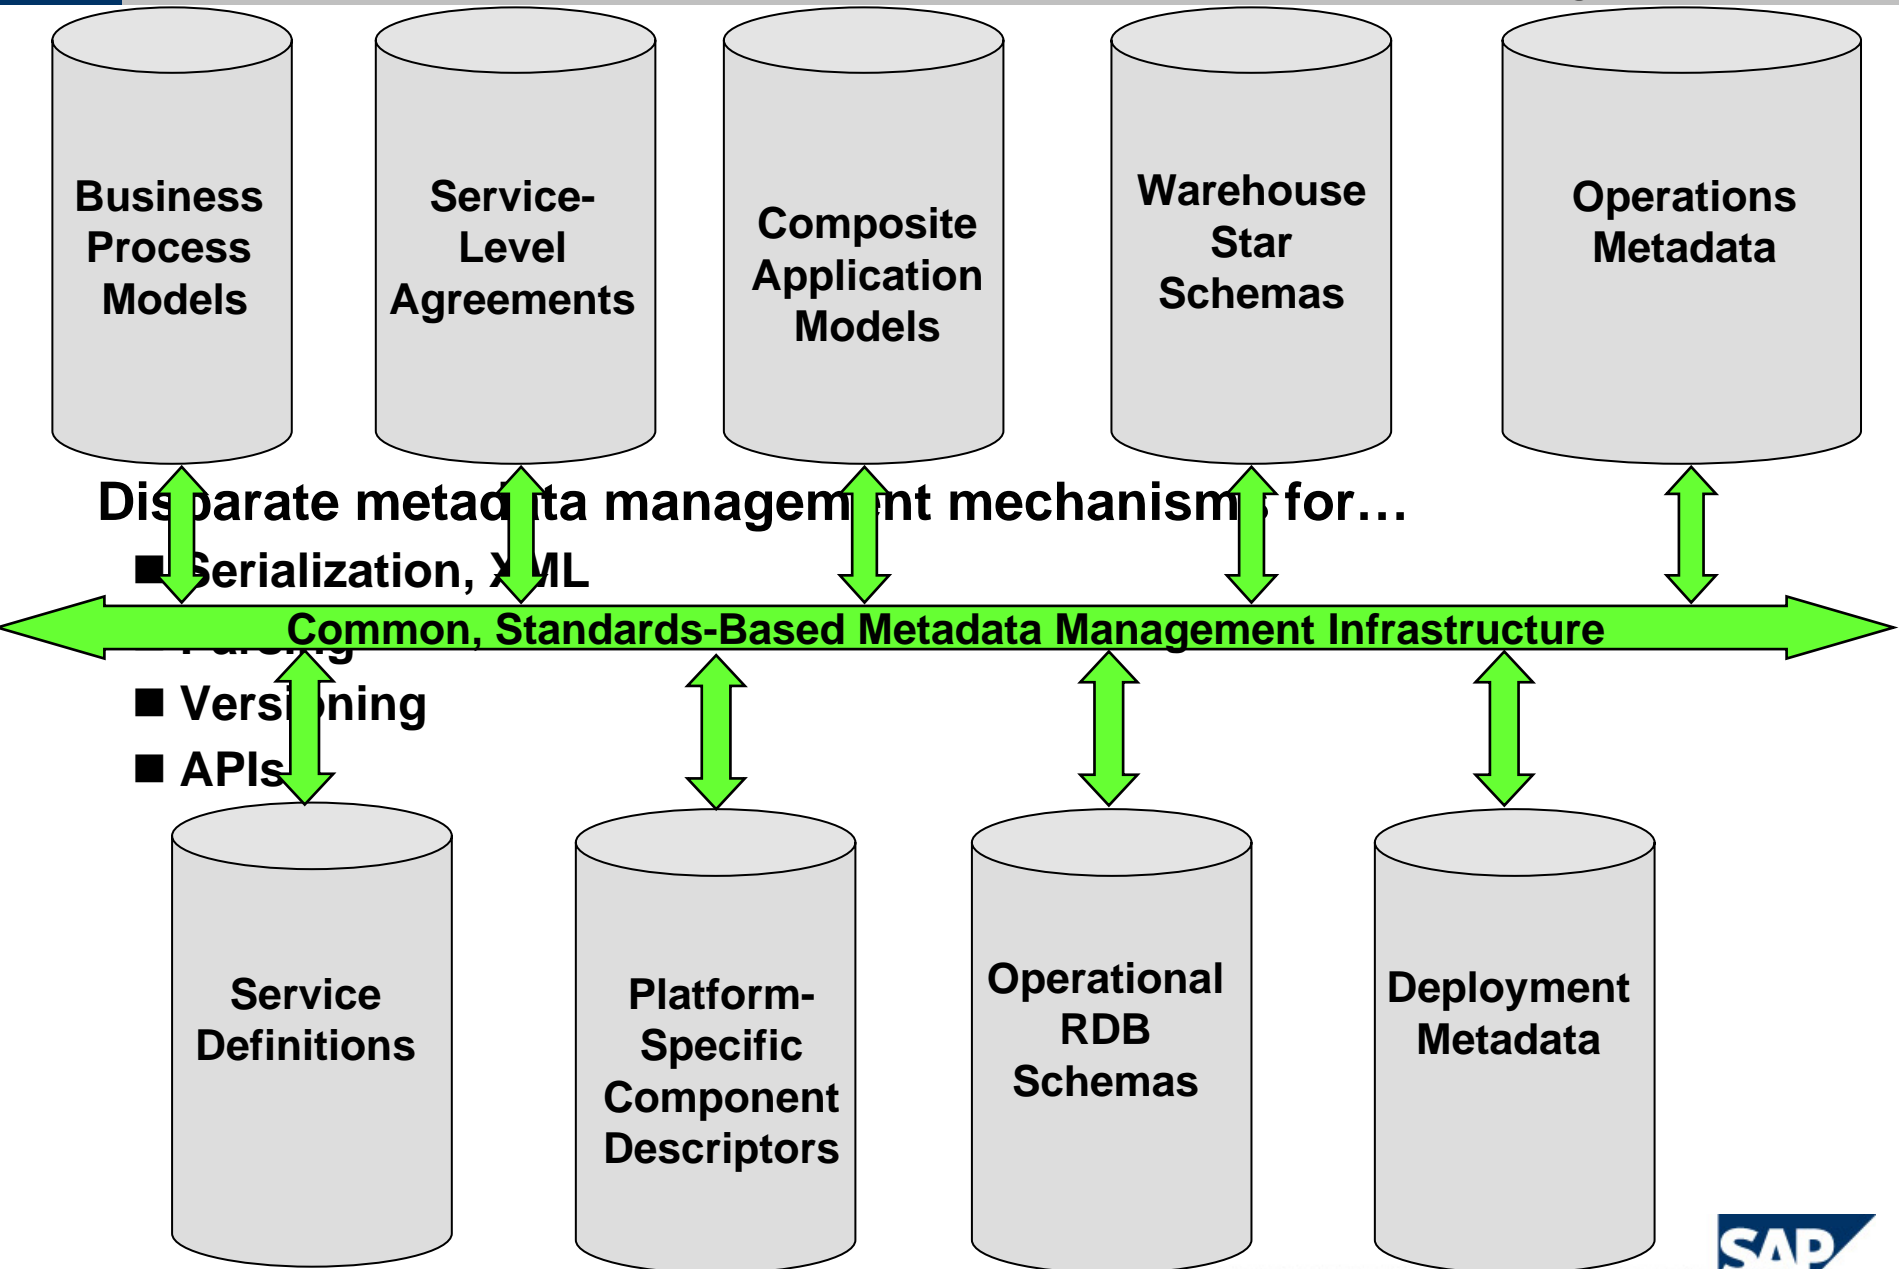

## Categories of tool support<sup>1</sup>

- **Constraint checking:** Checking whether a particular configuration satisfies the constraints
- **Constraint propagation:** Inferring the values of undecided configuration settings from the values of decided settings
- **Constraint satisfiability:** Checking whether a set of constraints has at least one solution

<sup>1</sup>Krzysztof Czarnecki and Chang Hwan Peter Kim, "Cardinality-Based Feature Modeling and Constraints: A Progress Report," Proceedings of the First International Conference on Software Factories, OOPSLA 2005.

# Metadata Across the Lifecycle

Model-Driven = Metadata-Driven (With Traceability)

## **Business process platforms are coming**

- **Transition will be gradual, but powerful**
- **Model-driven tools are important for making the platforms usable**
- **Providing business value today, more in the future**

## **Configuration management has to be faced square-on**

**Metadata-rich environments and formal grounding needed to manage the complexity**

**Vigorous competition for a growing pie—if we do this right**

# Backup

## How do you build reusable components?

- Component-based development has proven hard in practice
- How do you anticipate requirements of composite applications?

# Product Line Practices

Individual Product 1

Individual Product 2

...

Individual Product n

Individual systems produced via *product development*

Production Plan

The Sims "Water Line"

Reusable assets for the product line  
Created via *core asset development*

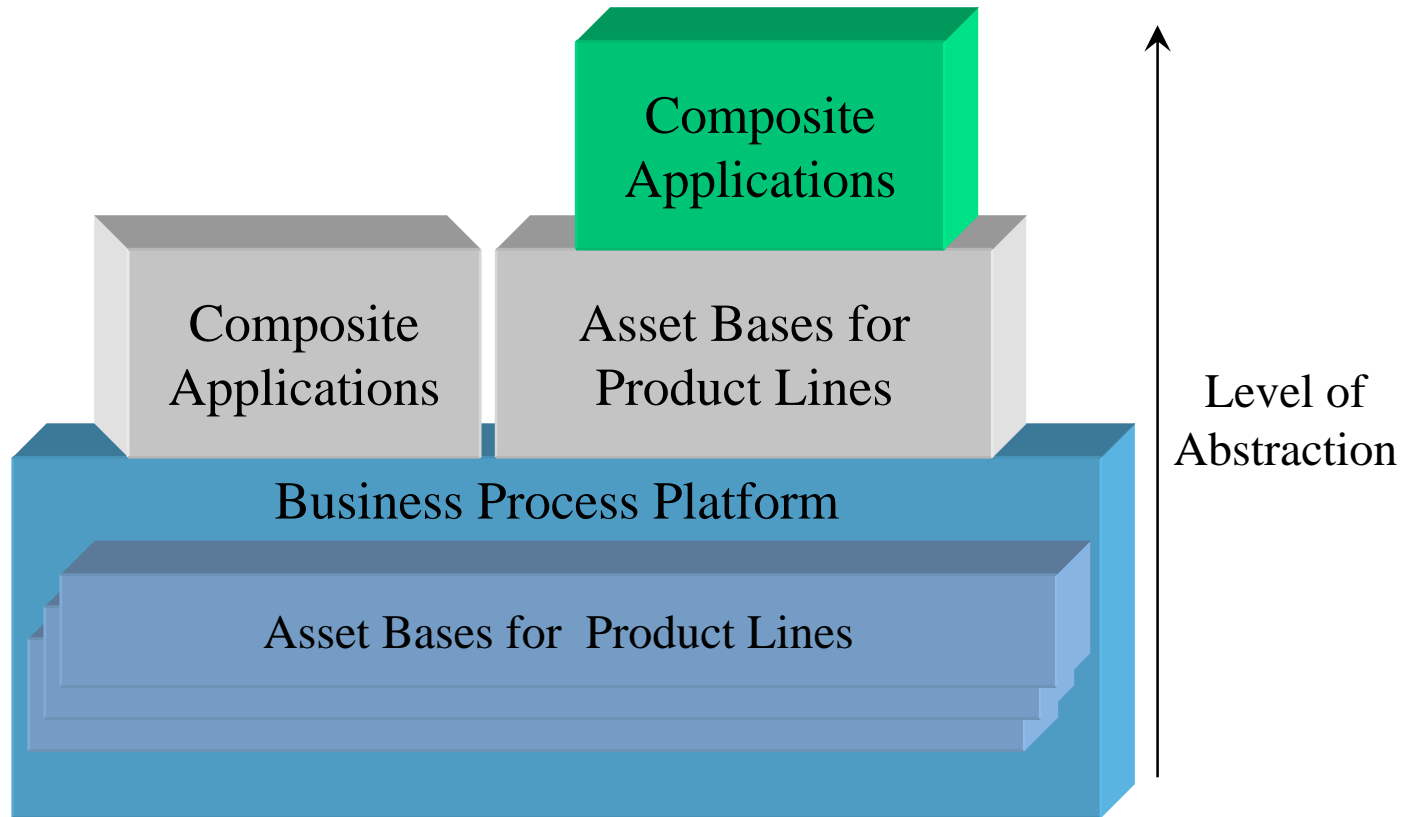

Architecture

Components

Specialized Compiler(s)

Domain-Specific Language(s)

# Applying Product Line Practices

## MS Office is a *desktop application platform*

- Has hundreds of components (has had them for 15 years)
  - ◆ Stateless: e.g. a thesaurus component
  - ◆ Stateful: CRUD operations on office documents and calendars
- Powerful tools for rapid assembly of innovative desktop applications
  - ◆ Visual basic
  - ◆ Code wizards

## A BPP has an *enterprise application platform*

- Will have hundreds (or more) components
  - ◆ Stateless, e.g. calculations
  - ◆ Stateful: CRUD operations on systems of record
- Model-driven tools
  - ◆ Composite application construction tools
  - ◆ Business Process Management tools

## Synergy

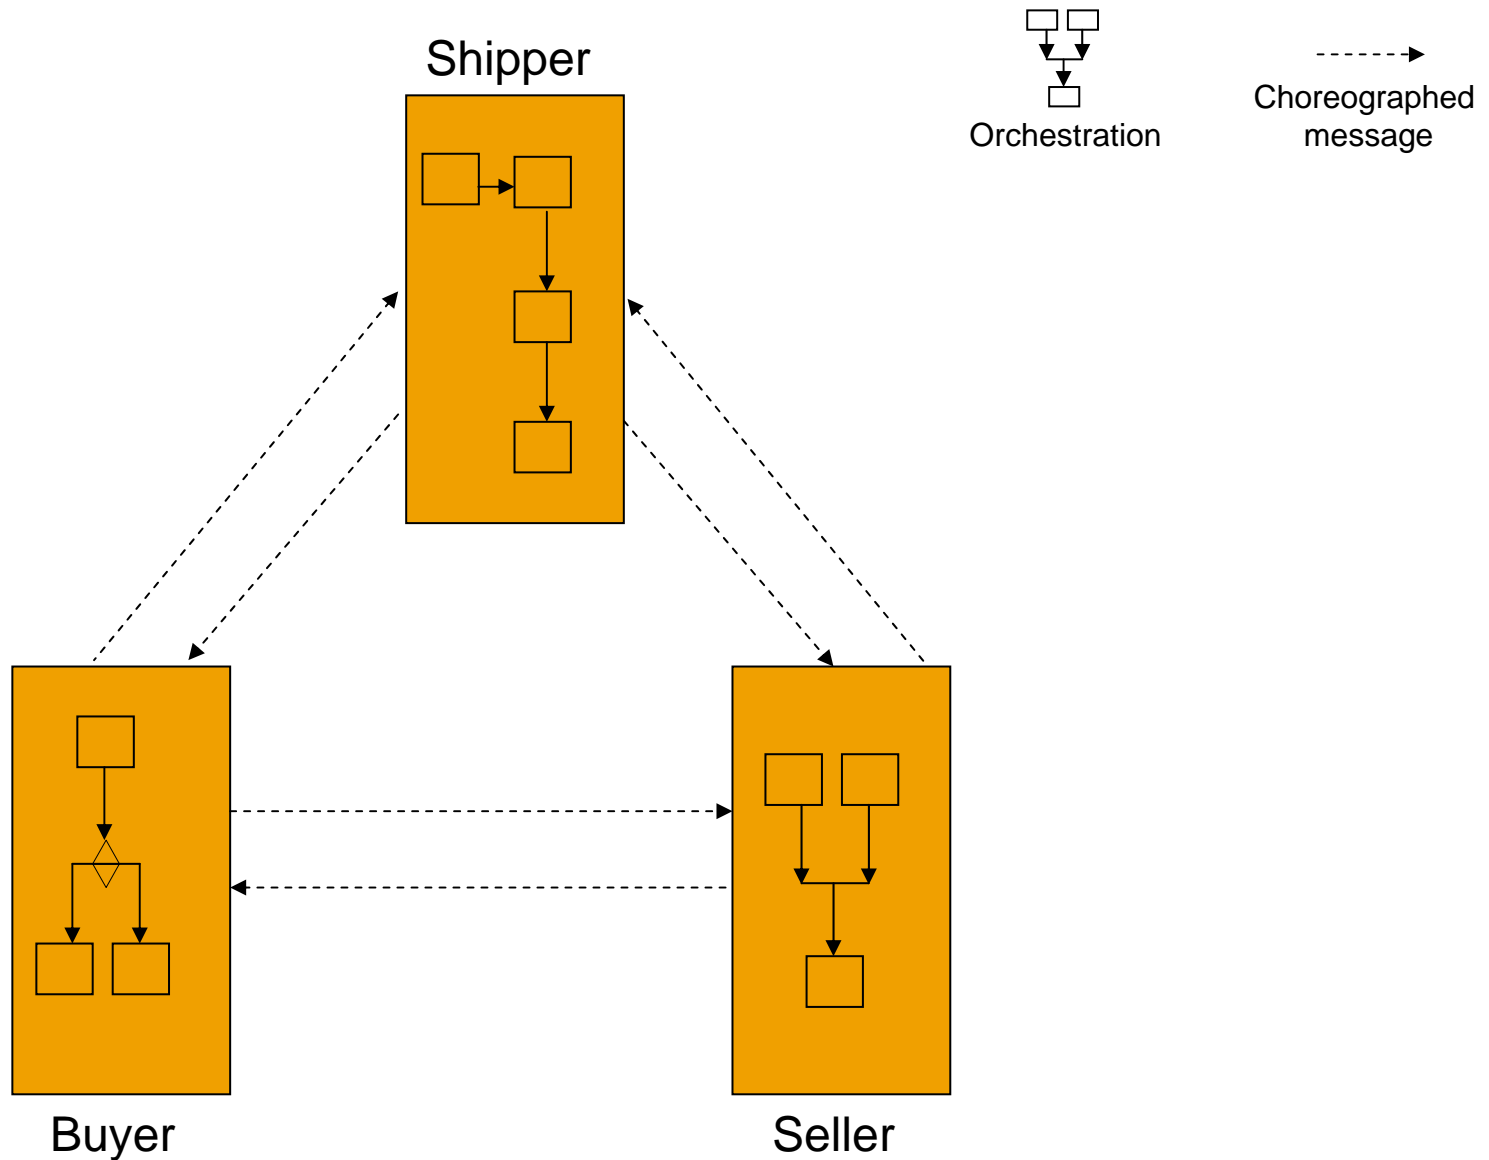

- Integrating desktop and enterprise application platforms
  - ◆ Opens up another order of magnitude of possibilities for innovative composite applications

# Business Process Modeling Notation (BPMN)

Example from "Introduction to BPMN" by Stephen White, IBM  
Available at [www.bpmi.org](http://www.bpmi.org)

# Collaborative Business Processes

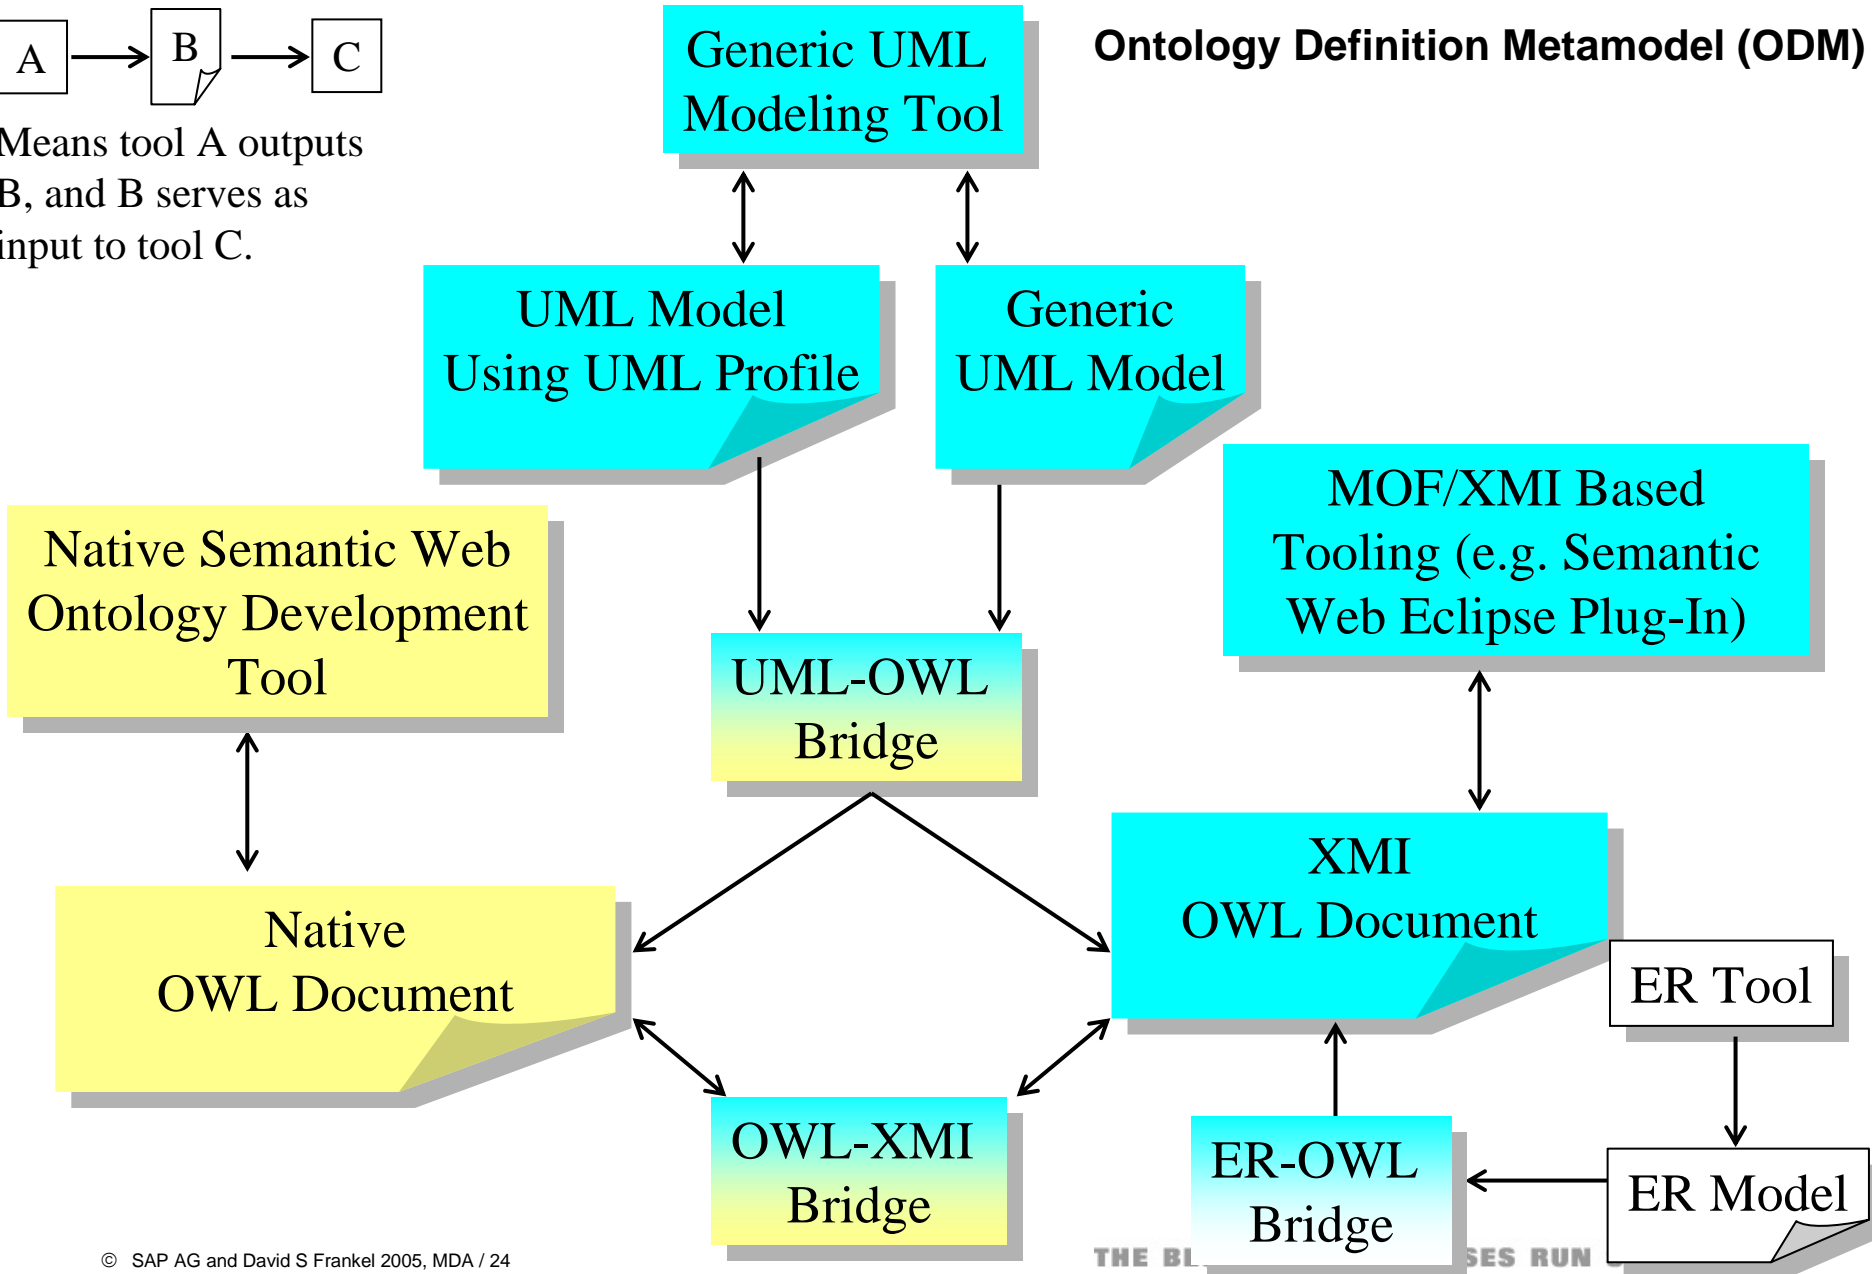

# Seeking Formal Grounding for MDA

## To Improve Automated Assistance

Means tool A outputs B, and B serves as input to tool C.
